Michigan Leads in Output of Malleable Castings

WASHINGTON, Dec. 11.—Commercial malleable iron foundries of the United States produced 585,616 net tons of castings, valued at \$81,064,855, in 1927, a decrease of 17.8 per cent in tonnage and 20 per cent in value as compared with 712,499 tons, valued at \$101,348,758, in 1925, according to data collected by the Bureau of Census in the biennial census of manufactures. Michigan, with 121,972 tons, valued at \$14,211,523 in 1927, led as the source of production, while Ohio ranked second with 80,932 tons, valued at \$11,020,268. Figures for 1927, the bureau pointed out, are preliminary.

Production by States for 1927 follows:

	Net Tons	Value
United States:		
1927	585,616	\$81,064,855
1925	712,499	101,348,758
States: 1927		
California	5,926	1,033,742
Connecticut	15,532	3,351,351
Illinois	79,165	10,359,792
Indiana	62,943	8,266,410
Michigan	121,972	14,211,523
New Jersey	7,973	1,855,539
New York	63,142	9,804,938
Ohio	80,932	11,020,268
Pennsylvania	41,029	6,995,557
Wisconsin	77,178	9,378,027
All other States ¹ ...	29,824	4,787,708

¹ Delaware, Georgia, Iowa, Maryland, Massachusetts, Minnesota, Missouri, Rhode Island, Tennessee, Texas and West Virginia. The figures for these States are combined to avoid disclosing the production of individual foundries.

Metal Tariff Hearings in January

Sweeping Changes Believed Unlikely but Upward Revision May be Sought on Bars, Shapes, Cast Iron Pipe and Other Products

BY L. W. MOFFETT

WASHINGTON, Dec. 11.—Changes in the metals schedule of the Fordney-McCumber tariff act when that law is overhauled promise to be limited when compared with the 300 items, more or less, in the schedule. It is unlikely that any of them will be of a sweeping character. The more important revisions may pertain to reclassification and administrative features rather than to duties.

There will be demands, however, for important changes in the metals schedule. This schedule will be the object of hearings on Jan. 14, 15 and 16 before the House Committee on Ways and Means. No schedule has been given more than three days for hearings. The hearings, 31 in number, are to be begun on Jan. 7 and will extend through Feb. 25.

The House committee has adopted a policy of not announcing those who have applied to be heard or of stating the names of the products which will be discussed. It is therefore not possible to say definitely what subjects will be presented in connection with hearings on the metals schedule. Developments under the existing law, however, lend a basis for the belief that a number of items will be discussed. Among them probably will be reinforcing bars, structural shapes, deep-section interlocking sheet piling, cast iron pipe, manganese ore, cutlery, pig iron, tungsten and certain types of machine tools. At its annual convention here last week the American Mining Congress adopted a resolution for continued protection to the minerals industry.

Producers May Ask for Higher Duties on Bars and Shapes

Domestic manufacturers have long expressed dissatisfaction over duties applicable to reinforcing bars and structural shapes and have complained about the volume of imports of these products. Concern manifested has been increased by the recent decision of Justice I. F. Fischer of the United States Customs Court, Second Division, who held that deformed bars are structural material and as such are dutiable under paragraph 312, taking an impost of 1/5c. per lb. or 20c. per 100 lb., instead of under paragraph 304, carrying a duty of 3/10c. per lb. or 30c. per 100 lb. It is reported that efforts will be made to get a separate classification for reinforcing bars with a duty higher than that applying under the decision of Justice Fischer. It is also understood that attempts will be made to

get higher duties on structural shapes and deep-section interlocking sheet piling, the latter classified as structural material, a classification which does not meet with the approval of domestic makers. Consequently, reclassification may be sought for this product. Formerly this particular kind of sheet piling was imported exclusively, chiefly from Germany. It is now made in the United States and manufacturers maintain that it requires greater protection to support the industry adequately against foreign competition.

Belgium is the principal source of imports of structural shapes and bars which, it is held, have been sold into this country at prices which domestic manufacturers often are unable to meet. Most of the structural shapes imported are of the bar size, used for such purposes as lintels, fire escape construction, warehouses, coping work, and other small work. Reinforcing bars coming from abroad have competed more generally in construction work with domestic bars of that type than have imported structural shapes competed with large structural shapes.

Cast Iron Pipe Imports Heavy

Many complaints have been made by domestic producers against relatively heavy imports at times of cast iron pipe, dutiable at 20 per cent ad valorem. A great volume of these incoming shipments originate in France with a substantial proportion coming from Belgium. There is now pending a complaint before the Tariff Commission seeking an increase of 50 per cent under the flexible provision (Sec. 315) in the duty on this product.

Ferromanganese and Manganese Ore May Again Be Contested

Manganese ore was one of the subjects of heated discussion at hearings when the Fordney-McCumber tariff legislation was under consideration. Domestic iron and steel producers generally argued for either a low duty or no duty on this product, and complaints have been made before the Tariff Commission asking for a reduction of the duty of 1c. per lb. on the metallic manganese content when in excess of 30 per cent. Requests also have been made to have the ferromanganese duty of 1 7/8c. per lb. on the manganese content reduced. The duties on both products may again be the subject of vigorous contest before the Ways and Means Committee

and the Senate Committee on Finance by producers and consumers. But it has been indicated that ferromanganese will play a less important part in the hearings than heretofore because of a much larger domestic production by steel works furnaces of the ferroalloy since the present tariff act was passed. Moreover, a reduction in the duty on ore would foreshadow a cut in the duty on the alloy. Domestic producers of manganese ore through the American Manganese Ore Producers' Association have made it plain ever since they organized that they will oppose a reduction in the duty. They contend that they are making progress through beneficiation in developing ore of good manganese content and that given continued protection they will be able to proceed with their research work and processes so that they can meet all domestic requirements for the making of standard ferromanganese. Domestic iron and steel producers generally do not accept this view. General investigation of the manganese situation was completed some time ago by the Tariff Commission and will be the subject of a report soon to be made, it is believed. This inquiry was not instituted under the flexible provision but rather upon the initiative of the commission itself under another section of the act.

Pig Iron Producers May Also Seek Higher Tariff

Interest in the pig iron duty is confined chiefly to Eastern merchant blast furnace operators and importers. Producers succeeded, on the strength of large imports which were entering the country, in having the Tariff Commission make an investigation under Sec. 315, which resulted in a proclamation by President Coolidge increasing the duty by 50 per cent, of 37.5c., from 75c. to \$1.125 per gross ton. The Tariff Commission in its report on pig iron said that differences in costs in the United States and abroad indicated that a higher duty than was warranted under Sec. 315 was required to protect the American industry. It has been suggested that this would afford domestic makers a strong argument for seeking a higher duty. Imports of pig iron during the past few months have been light. For the 10 months ended October, 1928, they totaled 118,885 tons, as against 102,127 tons for the corresponding period of last year.

Producers of tungsten ore are known

to be preparing to ask higher rates on this product as well as on its manufactures, including ferrotungsten and tungsten steel, which take compensatory duties.

Machine Tool Builders May Seek "Unfair Trade" Protection

It is reported that machine tool manufacturers will make protests against certain kinds of imports and seek further protection. There has been considerable complaint that Germany is making "Chinese" copies of American machine tools, but without the high quality or efficient performance of the latter. On the other hand, it is claimed that there are some high-grade German tools imported into the United States which are invoiced at remarkably low figures. In some quarters it has been asserted that action might be taken for application of the "unfair trade practices" section of the tariff act, carrying the drastic embargo power.

Two other items of interest to the iron and steel industry which may be the subject of hearings are magnesite and fluorspar. They were the object of conflicting testimony at the hearings when the present act was in the course of preparation. Magnesite, however, apparently does not share the interest it formerly did. Imports have been light recently, and have not been heavy for a long period, owing evidently to the ability of domestic producers to meet foreign competition. Eastern iron and steel makers chiefly are interested in the duty on fluorspar. It recently was increased by 50 per cent, or \$2.80 per gross ton, from \$5.60 to \$8.40, by Presidential proclamation following a report by the Tariff Commission based on a complaint under the flexible provision by domestic producers. Eastern iron and steel manufacturers had asked for a reduction in the duty.

Sweeping Changes Are Believed to Be Unlikely

The plans of the Republicans to overhaul the entire tariff law are consistent with pledges made during the recent Presidential campaign. By general revision was meant the purpose to go through the whole law and make all the changes at one time as contrasted to piecemeal revision. It is hardly believed, however, that the Republicans will proceed to the point of making sweeping changes in duties applying to the present Republican tariff. The changes contemplated, it is held, are largely required to meet economic and industrial adjustments that have developed since the existing law went into effect in September, 1922. Contention is made that the law has, in the main, operated quite satisfactorily throughout.

The changes in prospect, then, may be looked upon as a sort of leveling-out process, a form of readjustment to meet present-day conditions of competition. Changes in administrative sections are to be the subject of discussion on the last day of the

hearings before the Ways and Means Committee. Much interest is being shown as to the possible revision or repeal of the flexible provision. It has been the source of a great deal of complaint. One objection is that it has been difficult for the Tariff Commission to ascertain costs of production from foreign manufacturers. Another is that this procedure has required such protracted investigation that frequently before the commission has been able to report to the President conditions existing at the time complaints were filed have changed entirely. Meanwhile, the domestic industry had to endure conditions complained of without getting relief at the time it was needed. A great deal of contention has been made that it would have been more satisfactory had the commission relied entirely on foreign invoices on imports, a resort turned to in instances where costs abroad could not be obtained.

There also is considerable sentiment that the right to charge duties should be restored exclusively to Congress and the Tariff Commission be maintained solely as a fact-finding body, reporting to Congress alone.

American Valuations Suggested

There has been renewed discussion also of having duties based on American valuation instead of on foreign valuation. This question was discussed with considerable warmth when the present law was being considered. The foreign valuation basis was continued, except as to some items in the chemical schedule. The general view seems to be that it will not be changed. One argument is that foreign valuation can be more easily justified at the present time owing to greater stability of foreign currencies than it could in 1922, when foreign currencies fluctuated widely.

An important provision which may be asked for in the new law by domestic steel makers is a requirement that imported steel bear a mark showing the countries of origin.

Plans to begin hearings early in January look to speedy enactment of a revised law under the Hoover administration. It is the prevailing opinion that an extra session of the new Congress will be called for the spring by Mr. Hoover shortly after the present session comes to an end. Agricultural relief could also be provided. Such action is not expected to be taken at the present session.

Wants Special Session Postponed

Senator David A. Reed, Republican, of Pennsylvania, a member of the Finance Committee, is in favor of deferring the special session until next fall, but this is plainly a minority view. In the view of a spring session, however, Senator Reed has conceived the unusual idea that the Finance Committee should take the revised tariff bill as prepared by the House Committee and proceed with changes and revisions which the Sen-

ate committee may deem necessary without awaiting passage of the bill by the House. This would be done on the theory that the bill would be passed by the House practically in the form in which it will be reported by the Ways and Means Committee. With the Senate Committee proceeding under the Reed plan, the bill would be whipped into form ready to go before Congress as soon as Mr. Hoover returns from his South American trip and calls a special session. Chairman Smoot, Republican, Utah, of the Senate committee, has not indicated whether he approves of the Reed plan.

Bill May Be Rushed

Chairman Hawley, Republican, Oregon, of the House Committee, has expressed the belief that the committee can meet after the present session and have a tariff bill ready to present the middle of April or the first of May should President-elect Hoover call an extra session in the spring. Mr. Hawley also said he thought that the House could dispose of the measure in 10 days or two weeks. This would be rapid-fire action for such an important piece of legislation, even for the House of Representatives.

Showing the intensity with which the House committee is proceeding with its tariff-revision program plans is the fact that the Tariff Commission has been required to have ready by the end of December a report on each of the thousands of items, together with the administrative sections, in the entire law. Report will be made to committee. The commission staff is now busily engaged in preparing this report, which is a big task.

Oral testimony before the House committee will be confined, so far as practicable, to those who are qualified to give first-hand information. The committee has suggested that, in order to avoid duplication of arguments and to conserve time, those interested in the same items and having the same problems to present, agree, if possible, upon one representative to present their views. With regard to briefs, industries have been asked to file two copies in advance of their particular hearings, stating changes desired, the reasons therefor, and other material information.

Four Companies Taken Over By Foote Brothers

Stockholders of Foote Brothers Gear & Machine Co., Chicago, have approved an increase in authorized common stock to 250,000 shares, par \$5, from 120,000 shares, par \$5. The issuance was also approved for shares for the acquisition of stock control of the Lyle Culvert & Road Equipment Co., the Stockland Road Machine Co. and the Northwestern Steel & Iron Co., all of Minneapolis, and the Bates Mfg. Co., Joliet, Ill.

Program for Western Metal Congress

Steel Treaters Announce Speakers for Semi-Annual Meeting at Los Angeles in January

PREPARATIONS are rapidly maturing for the first Western Metal Congress and Western States Metal and Steel Exposition, which will be held in Los Angeles, Cal., Jan. 14 to 18, under the auspices of the American Society for Steel Treating. The congress is to be held at the Hotel Biltmore and the exposition in the Shrine Civic Auditorium.

Dr. Kotaro Honda of the Imperial University, Sendai, Japan, will be present to deliver a paper before the convention and to discuss other technical contributions to the program. Dr. Zay Jeffries, Cleveland, president of the A.S.S.T., is expected to deliver a paper on the use of aluminum in the construction of airplanes.

The following tentative technical program for the congress has just been made public:

MONDAY, JAN. 14

10 a. m.—Prof. W. H. Clapp, department of metallurgy and machine design, California Institute of Technology, Pasadena, Cal., chairman. Papers:

"The Importance of Shops in University Training," by Arthur B. Domonoske, executive head mechanical engineering department, Stanford University; "Gear Manufacturing, Including Heat Treatment," by F. A. Brooks, chief engineer Johnson Gear Co., Berkeley, Cal.; "Investigation of Fatigue Resistance of Eutectoid Carbon Steel When Drawn at Different Temperatures," by Mr. Watson, metallurgist Regan Forge Co., San Pedro, Cal.; "Heat Treatment of Dies, Tools and Gears," by Jordan Korp, Leeds & Northrup Co., Philadelphia.

2 p. m.—Foundry Division Program (Sponsored by Metal Trades and Manufacturers Association, Carroll A. Stilson, secretary); Mr. Stilson, chairman. Papers:

"Special Nickel Castings," by Paul D. Merica, assistant manager of research, International Nickel Co., New York; "Sand Testing Equipment and Demonstration," by A. A. Grubb, Mansfield, Ohio, (member of American Foundrymen's Association, sand testing committee); "Nickel-Chrome Alloy Iron," by W. R. Shimer, metallurgical engineer Bethlehem Steel Corporation, Bethlehem, Pa.; "Heat Treatment of Carbon and Alloy Steel Castings," by J. E. Donnellan, of the A. S. S. T., Cleveland, secretary recommended practice committee; "Furnaces," by R. E. Talley, president George J. Hagan Co., Pittsburgh.

TUESDAY, JAN. 15

10 a. m.

"Selecting Metals and Alloys for Severe Services Involving Corrosion, Erosion, and Heat Resistance, with Particular Reference to Oil Refinery Conditions," Speaker to be announced. "Valves and Fittings in the Oil Refinery, the Materials Used in Their Construction, Their Design, and Their Application in Particular Services, and High-Pressure Oil Conveying and High-Pressure Gas Distribution." Speaker to

be announced. "Tendency toward Higher Steam Pressures in Both Marine and Stationary Services, the Materials Available for the Construction of Boilers for these Higher Pressures, and Some of the Factors Involved in their Design," by Robert L. Daugherty, professor mechanical engineering, California Institute of Technology. "Heat, Insulation and Insulation Materials, their Properties and their Applicability for Particular Conditions Met with in Furnace Design, Industrial and Marine Boiler Services, and Services in the Chemical Industries Involving Corrosive Conditions Combined with High Temperatures." Speaker to be announced.

2 p. m.—American Society of Mechanical Engineers, H. H. Anderson, chairman of program committee.

The arrangement thus far made for this group for their particular session is in the form of a symposium of five papers on the manufacture of oil field specialties: "Tool Joints," by E. W. Goesor, Emsco Derrick & Equipment Co., Los Angeles; "Cast Steel Slush Pump Cylinders," by Lester Keim, Oil Well Supply Co. of California; "Kellys, or Grief Stems," by E. W. Timbs, National Supply Co.; "Sucker Rods," by W. H. Laury, Axelson Machine Co.; "Heat-Treated Drill Pipe," by a representative of the Standard Seamless Tube Co.

These five papers will be rather similar in the method in which the material is organized, touching chiefly upon the service to which they are subjected, the raw material used, together with its physical property, the forging and heat treating of same, the gaging and control of production.

WEDNESDAY, JAN. 16

10 a. m.—American Petroleum Institute, California Division of Development and Production Engineering, A. C. Rubel, district chairman, Union Oil Co., T. E. Swigart, national vice-chairman, Shell Co. Four papers scheduled:

"Sucker Rod Strains and Stresses," by F. W. Lake, Union Oil Co.; "Drill Pipe Failures," by Ben Stroud, National Tube Co.; "Casing Failures," by K. V. King, of Standard Oil Co. of California; "Welding and High-Pressure Gas Distribution," by C. J. Coberly, of Kobe, Inc.

2 p. m.—American Institute of Mining and Metallurgical Engineers, Glenn Robertson, Associated Oil Co., chairman of program committee and secretary. R. R. Boyd, chairman of the group, Richfield Oil Co. Four papers scheduled:

"On the Double Diagram of the Iron-Carbon System," by Dr. Kotaro Honda, research institute for iron and steel, Imperial University, Sendai, Japan; "Proposed Metallurgical Control for Small Heat-Treating Plants," by Dr. Welton Crook, professor of metallurgy Stanford University; "Electroplating and the Uses of Copper in Machinery," speaker to be announced later; "Heat Treatment of Gears," by W. H. Phillips, vice-president Molybdenum Corporation of America, Pittsburgh.

THURSDAY, JAN 15

10 a. m.—Pacific Coast Gas Association, C. M. Grow, new business manager Southern California Gas Co., chairman of program committee. Five paper scheduled:

"Gas and Electricity as Heat Mediums," by F. W. Manker, vice-president Surface combustion Co., Toledo, Ohio; "Heat-Treating Furnace Design," by J. H. Gumz, industrial engineer Pacific Gas & Electric Corporation, San Francisco; "Existing Heat-Treating Installations," by E. M. DeReamer, industrial engineer Southern California Gas Co., Los Angeles; "What the Gas Companies Are Doing For Industrial Heating," by C. M. Grow, new business manager Southern California Gas Co., Los Angeles; "Gas as Applied to Carburizing," by Robert G. Guthrie, metallurgist Peoples Gas Light & Coke Co., Chicago.

2 p. m.—Pacific Coast Electrical Association, R. C. McFadden, new business manager Southern California Edison Co., chairman. Four papers scheduled:

Address by Paul Downing, vice-president Pacific Gas & Electric Corporation, and president of the Pacific Coast Electrical Association; This session will be in the form of an illustrated symposium on "Electric Heat as Applied to Industry," by C. L. Ipsen, consulting and designing engineer of the industrial heating and welding department of the General Electric Co. Another paper has been prepared, by Gilbert D. Fish, of Westinghouse Electric & Mfg. Co., on "Design as Applied to Arc-Welded Construction."

FRIDAY, JAN. 18

10 a. m.—Society of Automotive Engineers, Ethelbert Favary, Moreland Motor Truck Co., chairman of program committee. Papers follow:

"Manufacture and Heat Treatment of Automobile Leaf Springs," by J. B. Rauhen, general manager United States Spring Co., Los Angeles; "Production of Nickel Steel Castings by Electric Furnace Method," by E. Favary, consulting engineer Moreland Truck Co.; "Aluminum as Applied to the Automotive and Airplane Industry," by Dr. Zay Jeffries, chief research engineer Aluminum Co. of America, Cleveland; "Some Phases of Aircraft Construction." Speaker to be announced. "Metallurgical and Heat-Treating Problems in Motor Car Manufacture (illustrated with moving pictures)," by J. M. Watson, chief metallurgist Hupp Motor Car Co.

2 p. m.—American Welding Society, A. E. DeBurn, Pacific Pipe & Supply Co., chairman of program committee.

"The Welding of Steel Buildings and Bridges," by Dr. Frank P. McKibbin, consulting engineer for the General Electric Co. (The American Society of Civil Engineers, the American Institute of Electrical Engineers and the American Institute of Architects will participate in this meeting.) "Heat Treatment with Oxy-Acetylene Flame," by J. J. Bruton, service engineer Oxweld-Acetylene Co., New York; "Building Machinery with Arc-Welded Steel Replacing Castings," by David Hall, district engineer Westinghouse Electric & Mfg. Co. of Los Angeles.

All morning sessions will be held at the Biltmore Hotel, and all afternoon sessions at the Shrine Auditorium.

Substitutes Used For Strategic Metals

War Department Finds That Ingredients Regarded as Essential in Case of War Can Be Provided By Other Elements

WASHINGTON, Dec. 11.—Work of the War Department in providing for adequate supplies of essential raw materials for use in possible hostilities was outlined to the annual convention of the American Mining Congress on Friday afternoon of last week by Assistant Secretary of War C. B. Robbins. The plans call for strict economy and curtailment or abolition of unnecessary uses of raw materials; ascertainment of materials of domestic origin which can be substituted for those minerals which are not in abundance in the United States; increasing domestic production; and procuring and storing in peace time an adequate supply to carry the country through an emergency.

Among minerals classed as strategic were tin, chromium, manganese, mercury, antimony, nickel and tungsten. Regarding antimony, Mr. Robbins said that there has been a reduction in military requirements for this metal by substitution of an alloy of lead with barium and calcium. Much work, he said, had been done looking to the provision of substitutes for tin in its manifold uses. By replacing bearing metals and solders containing tin with alloys containing little or no tin, he said, the department has been able to reduce its figures for direct military requirements of tin for two years from 20,000 to about 15,000 tons. It was stated that the work which is now in progress on food containers promises ultimately a much larger reduction.

"Until recently," said Mr. Robbins, "tungsten has been regarded as absolutely essential to the production of high-speed tool steel, but work which has been done by our molybdenum producers and at Watertown arsenal by our Ordnance Department leads us to hope that some day we may be able to eliminate practically all of our requirements for tungsten in tool steel. It is believed that when the technique of manufacture has been adequately worked out we shall be able to make perfectly satisfactory cutting tools of a molybdenum alloy to replace the present tungsten alloy. The molybdenum tool is fully as satisfactory as the tungsten tool. In fact, molybdenum tools that have been used in the shops at Watertown arsenal have been preferred by the workmen to the tungsten tools. We have, however, still to perfect a process which will assuredly make every molybdenum steel tool as satisfactory as every other molybdenum steel tool. If this substitution is made we can reduce our requirements for both direct and secondary uses by at least 40 per cent.

"With respect to nickel, it is interesting to note that while we formerly specified nickel steel for all artillery we now find that substitution can be

made on nickel steel with satisfactory results, up to and including the 155-mm. gun. This, of course, effects some reduction in our requirements for nickel."

The convention adopted resolutions for continued tariff protection to the mineral industries, revision of the national tax laws to relieve the mining industry of burdensome taxes, and increased funds for mining investigations by the Federal and State Bureaus of Mines and Geological Surveys. S. L. Mather of Cleveland,

vice-president of the Cleveland-Cliffs Iron Co., advocated removal of State and Federal inequalities in the iron ore mining industry. He discussed conditions in the industry in Minnesota, Michigan and Wisconsin.

The following officers were elected: President, Robert E. Tally, Clarkdale, Ariz., general manager United Verde Copper Co.; first vice-president, William H. Lindsey, Nashville, Tenn., president Napier Iron Works; second vice-president, Jesse G. McDonald, Leadville, Colo., president Downtown Mines Corporation, and former governor of Colorado; third vice-president, S. L. Mather, Cleveland, president Cleveland-Cliffs Iron Co.; secretary, J. F. Callbreath, Jr., Washington.

Centralized Lubricating System

Changes in details of the Farmer System of Lubrication, described at page 416 of our issue for Feb. 10, 1927, have permitted the system to distribute either oil or grease. A wide range in gun capacities is said to justify installation on small machine tools as well as on large ones, and to permit grouping of many machines on a single reservoir and gun. There has been a change in management accompanying the change in the system. The Farmer Lubricating System, Detroit, has been absorbed by Lubrication Devices, Inc., Battle Creek, Mich., and the name has been changed to Farval Centralized System of Lubrication; this name is part of a registered trademark.

Positive measuring devices located at each bearing have been fitted with screens in the valve to keep foreign matter out. A glycerine fiber gasket forms a perfect seal when the system is idle and thus permits use of very light lubricant. With its positive

measuring valve at each bearing, this system is said to put plant lubrication on a production basis. It becomes possible to lubricate completely an entire machine or group of machines from one central station. It provides great safety for the operator, reduces the labor of oiling and delivers at high pressure to each bearing the lubricant required.

Two units are shown installed on 50-ton overhead electric traveling crane of 80-ft. span. As will be seen, one gun is mounted on the trolley and the other on the bridge. Together they lubricate 43 points with grease. Some of the features of operation of this installation are as follows:

With the old grease-cups it took a man an hour to lubricate this crane and it usually was done on overtime. Complete lubrication is now accomplished in about 2 min., eliminating danger to the oiler. Lubricant consumption daily with the old method was 2½ lb. Under the present system it is ¼ lb. of grease a day. Economy in the labor of oiling is estimated at \$300 a year.

Centralized Lubricating System on a Traveling Crane, Using One "Gun" on the Bridge and One on the Trolley. Tubes carry the grease, under controlled pressure, from the guns, to the many points of application

November Shows a Drop of 8½ Per Cent from the Record-Breaking Ingot Production of October, but It Was the Largest November Tonnage Ever Made. On the basis of daily averages the figures were high. Prices were fractionally better than at mid-year

Highest November Ingot Production

Steel Output Continues at Record-Breaking Rate—11-Month Total
5½ Per Cent Ahead of 1926 and 14 Per Cent Ahead of 1927

PRODUCTION last month of open-hearth and Bessemer el ingots in the United States, as reported by the American Iron and Steel Institute, was the highest ever recorded for November. The calculated output, at 4,259,380 gross tons, displaced the previous November high of 3,902,900 tons, which was recorded in 1925. The figure compares with 3,127,015 tons a year ago, and with the record-breaking total of 4,647,891 tons in October, which had 27 working days against 26 in November.

Eight months of the 11 so far this year have shown calculated outputs of more than 4,000,000 tons in each instance. Never before has any year contained more than four 4,000,000-ton months; 1926 had four, while 1927 had three such months and 1925 and 1923 each two.

For the 11 elapsed months of the

year, calculated production has reached 45,837,791 tons. This is the largest amount for the first 11 months of any year and exceeds the 12-month figures of all previous years except 1926. The largest previous total for 11 months was in 1926, with 43,469,439 tons. Thus the present year is 5.4 per cent higher than the previous record. (Inasmuch as the earlier figure included both crucible and electric steel ingots, which are no longer reported by the institute, the actual gain is considerably higher than that indicated above.) Compared with last year, there is an increase of more than 5,600,000 tons, or 14 per cent. In fact, the 11 months have exceeded the entire 12 months of 1927 by more than 2,400,000 tons.

Compared with October, November showed a falling off in open-hearth steel of nearly 10 per cent. As to

Bessemer steel, however, the drop was only 1¼ per cent. When comparison is made with last year, however, it is the open-hearth that has shown the greatest gain. The increase in 11 months has been more than 15 per cent, against about 7 per cent for Bessemer steel. October made a new record in open-hearth steel, as well as in total ingots.

On the daily basis, November showed an average of 163,822 tons for each of the 26 working days. This compares with 172,144 tons, the new record established in October. It compares also, however, with only 120,270 tons in November, 1927. Allowances for crucible and electric steel ingots would increase the November figure to nearly 165,000 tons a day. Details of the first 11 months of this year, with comparisons for last year, are covered in the table.

Steel Corporation's Orders Decline in November

For the first time since July the unfilled orders on the books of the United States Steel Corporation showed a decrease. On Nov. 30 the total was 3,673,000 tons, a decrease of 78,030 tons from the 3,751,030 tons on Oct. 31. In October the increase was 52,662 tons; in September, 74,325 tons, and in August, 53,116 tons, but in July the decrease was 66,082 tons. A year ago, on Nov. 30, the unfilled orders were 3,454,444 tons, or 218,556 less than on Nov. 30 this year. The table gives the reported figures for the last 23 months.

	1928	1927
Jan. 31.....	4,275,947	3,800,177
Feb. 28.....	4,398,189	3,597,119
March 31.....	4,335,206	3,553,140
April 30.....	3,872,133	3,456,132
May 31.....	3,416,822	3,050,941
June 30.....	3,637,009	3,053,246
July 31.....	3,570,927	3,142,014
Aug. 31.....	3,624,043	3,196,037
Sept. 30.....	3,698,368	3,148,113
Oct. 31.....	3,751,030	3,341,040
Nov. 30.....	3,673,000	3,454,444
Dec. 31.....		3,972,874

At the end of April, 1917, the highest total in unfilled orders of the Steel Corporation ever attained was reported, at 12,183,193 tons. The lowest figure ever reported was 2,754,757 tons, Dec. 31, 1910.

Record Earnings for Labor in New York State Plants

Average weekly earnings of employees in representative New York State factories in October are reported by the State Industrial Commissioner at \$29.78, equalling the record made in March of last year. The gain over September was 6c., while there was an increase of 50c. compared with October, 1927. Only in April was the average in any month this year below \$29. Last year, July and November were below that figure.

There has been a gradual increase since 1922 in the yearly averages. In 1923 this was \$27.24. It reached \$27.68 in 1924, \$28.26 in 1925, \$29.02 in 1926, \$29.30 in 1927, and \$29.35 in the first 10 months of 1928. All of these figures subsequent to 1924 have exceeded the average of \$28.15 recorded in 1920, the year of inflation.

Makes Industrial Use of Talking Movie

First to use the talking motion pictures for an industrial or advertising purpose, the Graham-Paige Co., Detroit, has adopted the "Talkie" to deliver a message to its dealers throughout the country, urging them to attend the Graham-Paige dealers' convention in Detroit, Jan. 3 and 4, just prior to the New York automobile show. A satisfactory demonstration of this new use of the talking films was made in Washington, in early December, before a group of 50 Graham-Paige dealers, guests of the company at a luncheon in the

Mayflower Hotel. Included in the film are short addresses by each of the three Graham brothers, making it the first opportunity the Graham Brothers have had to deliver personal messages to their dealers throughout the country.

A portable apparatus has been constructed in which the complete reproducing and projecting machines, together with films and loud speaker, are packed in three trunks no larger than the average wardrobe trunk.

Newark Foundries Are Consolidated

Sacks-Barlow Foundries, Inc., Newark, N. J., has been formed to take over and consolidate Louis Sacks, Inc., 357 Wilson Avenue, and Barlow Foundry, Inc., 551 New Jersey Railroad Avenue, both specializing in gray iron castings. The new organization has acquired by purchase the property and business of the Morrison-Flockhart Foundry Corporation, 216 Rome Street, specializing in similar castings, and which will be consolidated with other interests. The Newark Malleable Iron Co., 357 Wilson Avenue, heretofore operated as a subsidiary of Louis Sacks, Inc., will be included in the merger, continuing in the production of malleable iron castings.

Walter Kidde is chairman of the board of the new organization; David L. Sacks, president; Samuel F. Dixon, vice-president; Arthur E. Barlow, treasurer.

Gray Iron Institute to Hold Local Meetings

The Gray Iron Institute will hold two meetings in eastern Pennsylvania this week, at which the purpose of the institute will be outlined to foundry executives in the respective localities. Thursday evening, Dec. 13, a meeting will be held at the rooms of the Manufacturers' Association, York, and the following evening there will be a meeting in the rooms of the Berks County Manufacturers' Association in Reading. The meetings will be attended by Arthur J. Tuscany, manager of the institute; Albert E. Walton, Eastern representative, and B. H. Johnson, Cresson-Morris Co., Philadelphia, who is vice-president of the institute.

Large Building Operations in November

Building contracts placed in November in the 37 States east of the Rocky Mountains are reported by F. W. Dodge Corporation at \$471,482,000. This shows a gain of 1 per cent over November, 1927, but it is 21 per cent less than in October, 1928. Residential construction made up 42 per cent

of the total and accounted for \$200,226,000. Public works and utilities amounted to \$93,228,000, commercial building to \$68,309,000, and industrial projects to \$38,665,000. New projects contemplated were reported last month at \$931,114,000, representing an increase of 51 per cent over the October total and 13 per cent above last year.

Construction for the first 11 months is reported at \$6,195,530,000. This is an increase of 6 per cent over the amount started in the first 11 months last year. The territory covered accounts for about 91 per cent of the country's total construction. Of the eight districts reviewed, three have shown higher figures than for the entire 12 months of last year.

Obituary

CHARLES E. PIERCE, for 27 years territorial manager in central New York State for the International Harvester Co., Chicago, died at Schenectady, N. Y., on Dec. 3, aged 56 years.

HENRY O. TAYLOR, founder and president of the Taylor-Tenoning Machine Co., Rockford, Ill., died on Nov. 28, aged 54 years. He was born in New York and had been a resident of Rockford for 35 years.

GEORGE WIEGAND, president Standard Stamping Co., St. Louis, died at St. Luke's Hospital in that city Dec. 8, aged 65 years. Since the death of his father in 1908, he had been head of the company. He learned the tinner's trade under his father and when 14 years old became a traveling salesman for the company. In later years his three sons, Porter, James and George G., went to work for the firm, and the former is now vice-president.

WILLIAM H. WASWEYLER, president Milwaukee Brass Mfg. Co., Milwaukee, died suddenly on Dec. 1, aged 64 years. He was graduated from the University of Wisconsin in 1885 and became president of the company in 1892.

EMIL SCHROEDTER, for many years associated with the editorial direction of *Stahl und Eisen* and also prominent in the activities of the Vereins deutscher Eisenhüttenleute (German Iron and Steel Institute), died Oct. 31 at Bonn, Germany. He was born Feb. 26, 1855, and was one of the most prominent men in the German steel industry. A four-page tribute to Mr. Schroedter, giving in detail a history of his life and emphasizing his work as head of the German steel institute, is contained in the Nov. 22 issue of *Stahl und Eisen*.

This Issue in Brief

You can lose money by making a fixture that saves as high as 90 per cent on a certain operation, if you use it infrequently. On the other hand, a fixture used regularly, which saves as little as 5 per cent, may be a profitable investment. Frequency of use, interest, depreciation and obsolescence are some of the factors to consider before fixture is made or purchased.—Page 1489.

* * *

When installing a wage incentive plan, do not put the burden of selling the plan up to the incentive engineer. This is a job for the management to perform, for any new method is resisted throughout a shop until it has proved beneficial.—Page 1495.

* * *

Safety work demands the support of company officers. Safety is not entirely mechanical. The human element looms large. Unless managers and men cooperate, the purpose of the best of safety devices may be defeated.—Page 1496.

* * *

Tougher manganese steel made from pure manganese. Manganese made by the vacuum distillation method, 99.99 per cent pure, produces a carbon-free manganese steel, which is practically independent of heat treatment.—Page 1499.

* * *

Smallest plants more efficient than largest plants in two-thirds of industries surveyed. Using as a measuring unit the value of product per 1000 factory man-hours, investigators find, in 53 industries surveyed, that the smallest plant in 35 industries showed a better performance than the largest. Range of efficiency within individual industries was wide. In foundries, for example, the range was from 16 to 1.—Page 1500.

* * *

Can castings be made satisfactorily from blast furnace metal? Yes, says engineer. Doubts that remelting in cupola purifies the metal. Sulphur content is lower and silicon is conserved when blast furnace hot metal is made directly into castings.—Page 1502.

Proposed mileage freight rates penalize steel mills located near their markets, and favor long-haul competitors, say steel makers in freight rate hearings.—Page 1509.

* * *

Need for collective bargaining by wage earners is suggested by interests of society, says Taylor Society head. And this implies, he adds, the organization of workers on a basis extensive enough to make bargaining power effective, to the end that the weaker side may be represented in negotiations as to hours, wages, status and working conditions.—Page 1511.

* * *

Cost-reducing equipment finds good market in Germany. Germans are particularly receptive to offers of any kind of machines that will further the mechanization of industry, provided German machines are not available. Thirty to 90 days' credit without interest is demanded.—Page 1546.

* * *

No business cycle theory is used in business forecast employed by telephone company. The most complete array of business and economic facts is obtained. Then these are interpreted by the use of past experience, economic factors and common sense.—Page 1487.

* * *

Low production cost per piece is not always lowest ultimate cost. Increasing the number of runs per year on a certain part will raise the cost per piece, but may be justified by balancing production costs and fixed charges on inventory.—Page 1491.

* * *

Have you adequate information about your market? Few businesses are so small that they cannot support at least one man to study markets. It is just as important to study the business which you are not getting out of a territory as the business you are getting, says engineer. Many manufacturers are content to base their methods upon opinion, rather than upon facts.—Page 1503.

Wasteful methods in shop are revealed by wage incentive plan. Cases in which men are standing idle for causes beyond their control, and where existing equipment is insufficient, are revealed by a well-designed wage incentive plan. Dragging inefficiencies into the light transforms an organization which is working in a habitual routine into a thinking organization.—Page 1496.

* * *

Instead of searching frantically for further markets for your product, give a thought to finding other products your plant is adapted to manufacture. Conditions have changed, says economist. Formerly the things which were produced were all the things there were to be sold. Now the things which can be sold are produced.—Page 1498.

* * *

How soon should new equipment pay for itself? General practice is two years, but this depends on conditions in individual industries. Where the rate of obsolescence is rapid the cost of the equipment should be extinguished in a shorter time. If the class of work is stable the new equipment may be a good investment if it pays for itself in six or seven years.—Page 1489.

* * *

Increase output 15 per cent by installing new lighting system costing 2 per cent of the payroll. Nine plants, most of them metal-working, cut costs by providing adequate lighting, and at the same time decreased accident liability.—Page 1488.

* * *

Stove pipe in the mold prevents splashing of nickel steel during pouring, and thereby improves the surface of ingot. The stove pipe catches the splash, and melts quickly in the rising metal.—Page 1492.

* * *

How greatly will machine shops be affected by the new carbide cutting tools? One machine tool builder believes that the high speeds available with carbide tools are useful only to firms having acute problems of mass production.—Page 1494.

THE IRON AGE

ESTABLISHED 1855

W. W. MACON
Managing Editor

Unweighed Iron Exports Large

WHAT are called our "iron and steel exports" are regularly reported in gross tons, the statistics being familiar to all. The figures through October were given in THE IRON AGE of Nov. 29, October totaling 256,870 gross tons and the ten months of this year 2,384,301 tons. A continuance of the October rate for the last two months of the year would make a 1928 total of about 2,900,000 tons, by a margin of about 700,000 tons the largest since 1920.

The common reaction to such a showing is one of gratification. We are doing quite a business. We are, however, doing a much more important business for which weight statistics are not reported. The other merchandise exports of the United States this year actually contain in the neighborhood of one million gross tons of iron or steel. We name these figures after a careful study of the entire statement of merchandise exports. The study involved much estimating, there being basis for close estimates in many cases, particularly those involving the larger quantities, while in others not much more than a careful guess could be made. But all the estimating was done in conservative mood, and an actual count, if it were possible, would be likely to show more than a million gross tons.

The merchandise runs from freight cars to pianos, from bath tubs to tin cans and tinware, from automobiles to canned goods, from agricultural implements to printing presses.

Naturally customers of the iron and steel industry, manufacturers, canners, etc., have the heavy end of the "value product" in our exports. Still, it can be said that the bulk of the material represents a greater value per pound as it leaves the steel mill to go to the exporting consumer than does the material which the iron and steel producers export direct.

Entirely apart from such considerations, something needs to be said in appreciation of the million tons of iron and steel contained in the merchandise exports and in depreciation of the 2,900,000 tons of "iron and steel" exports. The first depreciation of the latter is a glaring one, for there is included over half a million tons of scrap! Pig iron and iron castings account for nearly 150,000 tons, and there is a considerable tonnage of semi-finished steel. We shall have for the calendar year's exports of steel products, beyond the semi-finished steel and including steel manufactures reported by weight in the regular classification, about 2,100,000 tons.

To the million tons of iron and steel contained in the exported merchandise we need to make additions to get to the steel mill basis of quantity. Instead of deducting for scrap, as in the other exports, we must add for

scrap made in manufacture, in the case of much of the tonnage, including steel used in producing automobiles, machinery, hardware, implements, etc. It is true of course that there is a considerable tonnage of iron castings.

Merely as a suggestion of the broadness of the field of these merchandise exports that contain iron and steel a few points may be mentioned. We export large quantities of oil in tin containers and over half a billion pounds of canned meat, fish, milk, vegetables and fruit. We export tinware, galvanized ware, enameled ware and sanitary ware. We export about half a billion dollars worth of electrical apparatus, machinery, office appliances and agricultural implements. Complete trucks and passenger automobiles run about 500,000 in number and car and truck engines about 150,000, other parts for assembly running in value over \$60,000,000, and parts for replacement fully \$50,000,000.

Steady Spending

THAT business has held so straight a course in recent years has been the puzzle if not the despair of forecasters. Trade simply has refused to indulge in the marked swings of former times. Only occasionally, quite too rarely, is it suggested that not enough attention is given to the human factor. We can find much explanatory material by gaging that factor, and thus it may be possible to work out something for the future.

Human nature may not change but styles do change. When in Rome, do as the Romans do. In that case one has moved into a new environment. But if the new environment comes and surrounds him it amounts to the same thing as to his conduct. The war produced tremendous changes in philosophies of life and other great changes have come since.

Steady spending has resulted. In the old days spending ran above the mean by spells and below it in intermediate spells. At one time there was "confidence" and at another time lack of confidence. Clearly it is an improvement to get away from these alternations, which were hard upon everybody except successful speculators.

The spending has been reasonably judicious. Manufacturers have been making large expenditures for new plants or for improvement in equipment of existing plants; but the object has been reduction in cost, which is always sound economics, rather than mere increase in capacity, which was sometimes unwise, freezing capital which it took years to thaw out.

There has been a great deal of building. When one recalls that two or three years ago there were warnings that in some sections at least building had been overdone, and yet the building has continued, there must

be doubt whether we shall overbuild. At the most the main result would be the depreciation of old structures that ought to have paid for themselves long ago. Such improvements are made that the newest buildings can never be in destructive competition with each other, whether they are hotels, office buildings, apartments or private dwellings.

Then we have to consider individual expenditures. It is several years now since instalment buying became a large factor in consumer merchandising. Thus far alarmist prophecies have not been borne out. Numerous cycles of these time payments have been completed and the business goes right along. In automobile buying the thing is so well established that the trade has annual statistics and can compare the percentage of "repossessions" in one year with the percentage of the preceding year. Perhaps the constant warnings against the abuse of the system have been a helpful check, as has the increasing amount of its retail purchases for which the public must pay cash, as chain store trade increases.

Somewhat puzzling is the relation of the stock market to this matter of spending. Are people putting incomes into it or taking them out? By precise arithmetical procedure it might be shown that everything balances, dollar by dollar; but we are looking at it from the human viewpoint—how individuals are affected in their conduct. If there is much spending due to speculative profits, that spending is going to stop some time. If people are putting in much surplus income, then in future they may spend corresponding money on goods or services and increase the general volume of business.

Were it not for the stock market and some things associated with it there would be a fairly clear picture of things running along at an even pace, menaced by little outside of pure accident, particularly destruction by war or nature.

Machining Manganese Steels

AN interesting piece of recent news concerns some machining experiments on Hadfield's cast manganese steel—that superlatively tough substance used for railroad frogs, steam shovel teeth and rock crusher jaws. To those who have battered away unsuccessfully at a thin fin with a cold chisel and hammer, it seemed almost a contradiction of terms to speak of machining such castings. Besides, the utility of such a development promised to be slight. Interesting, if true. If true, what of it? Who wants to machine such an alloy? Its entire utility has been developed with "non-machinability" in mind—any cutting had been done either with the oxy-acetylene flame or with a grinding wheel. The prime effort on the part of designer and foundryman is to make castings which do not require any such finishing.

Taking a broader view of the matter, however, it would appear that a considerable expansion in the use of high-manganese steel in rolled shapes or plates could be developed if they could be machined. For instance, cement mixer shells of rolled manganese steel plate should prove very successful where linings would be too bulky and heavy. Many types of battering tools, burglar proof devices, safes, armored car bodies, could use the alloy in forgings, bars or thin plate if they could be fabricated in the conventional way.

Again, we have recently discovered that the high-

chromium nickel steels are excellent to resist corrosion and scaling at high temperatures, and a large potential demand has appeared from the chemical industry. These steels are similar to high-manganese steel in that their microstructure is austenitic—all the alloying elements are in solid solution. It would seem that the problem of fabricating these new steels into equipment for high temperatures and pressures would depend very much upon the ability to shear, mill, drill, and otherwise manipulate them in the machine shop.

Thus it is already necessary to cut austenitic steels. Of course, some of these corrosion resistant steels are permanently austenitic in microstructure and consequently do not present the extreme difficulties of high-manganese steel (which, as is well known, changes locally by the cold work of a battering and cutting tool into martensite, the hardest of structures). But experience shows that many of them are so tough they machine with difficulty, even though not very hard as measured by conventional methods. In this they resemble some of the complex bronzes.

Consequently it is well that a considerable body of information is now available about how to cut austenitic manganese steel. High-speed steels containing several per cent of cobalt are the ones which have been able to turn the trick. It is necessary to use machines with an excess of power, rugged tools made with low clearances and rakes, chucked up short to eliminate chatter and vibration. Coolant is undesirable, and the chip comes off in a long curly ribbon so hot a cigarette can easily be lighted with it.

Observation of the action suggests that the frictional heat developed by the tool nose is so great that the metal being cut is heat treated just under the cut. Pressure against the manganese steel induces the austenite to martensite reaction which stops ordinary cutting; but if the local heat is more intense, the spot being cut would be tempered into the less resistant troostite. This reaction takes place readily in manganese steel; in fact, one manufacturer of plate containing 13 per cent manganese and 1.2 per cent carbon finds it to be machinable with great difficulty immediately after quenching from 1850 deg. Fahr. The Brinell hardness is only 170 and the microstructure is wholly martensitic. After drawing this quenched material for 16 hr. at 1050 deg. Fahr., the structure is mostly troostite, the Brinell hardness has increased to 387 but the machinability is improved at least four-fold. Requenching after machining restores the austenitic structure desired for wear resistance.

As remarked above, cobalt seems to be the element which imparts the additional red-hardness to the cutting edge sufficient to maintain its strength at frictional temperatures high enough to temper the work. Experiments seem to show that the low-tungsten high-vanadium steel plus cobalt (W 14 per cent, Cr 4, V 2¼, Co 4½) is the best for roughing cuts. The high-tungsten low-vanadium steel (W 18 per cent, Cr 4, V 1) plus cobalt is better for the lighter, finishing cuts.

Opinions vary as to whether 5 per cent cobalt is sufficient for the latter type of steels; at least one American and one English maker recommend a steel with tungsten up to 22 per cent and cobalt up to 12 per cent. Heat treatment standardized for high-speed steels is satisfactory, i.e., quench in oil from 2400 deg. Fahr., and draw at 1050. Somewhat better results

may be had from tools taking the first or roughing cut by drawing only to 600 deg. Fahr. This gives the maximum toughness for the body of the tool to resist the shocks; the cutting edge is rapidly heated to 1050 or 1150 deg. Fahr. by friction, and immediately develops the maximum secondary hardness at the point where it is most needed.

In this practice, where the heat developed by the tool is necessary not only to soften the work but to harden the cutting edge, use of any coolant would obviously impede the desired changes. Whether cutting fluids will be of advantage on the permanently austenitic steels is a question to be answered by future trials.

How to Ruin a Meeting

ONE does not need to attend many sessions of engineering or technical societies before he will overhear an older habitue pine for the meetings of yesteryear, when the formally scheduled paper was merely the signal for animated discussion from the floor, often taxing the chairman's ability to control. Such meetings are disparagingly compared with the present day American standard; then, it is averred, the real meat of the proposition was discovered in the extemporaneous talk; now, it is sure, the audience sits meekly, saying nothing, listening as a crowd of students, too modest to criticize their professor or loath to demonstrate that he does not know it all.

It is sure that this deadly dullness has been observed by the program committees. It is militating against the success of the societies. So they make every effort to provide some discussion beforehand—copies of the address are mailed to experts far and near, imploring them to read it and send comment. But then these fore-handed committees do this strange thing: they give such written comment right of way, instead of holding it as an "ace in the hole," to keep the meeting alive in case no other remarks are made by those present.

The easily imagined result of such practice was observed last week at one of the mechanical engineers'

meetings, and also last month at the steel treaters. A crowded program of four or five papers started with one of real interest to those present. After the author presented his subject, several members in the audience manifested a desire to comment or to ask a question. But no! Rules are rules. Afloat, women and children first; ashore, written discussion, first. So the available time was used up by reading (in the well-known vivacious manner) of page after page of comment. But even this could not dampen the ardor of those present who really wanted to start something. It remained only for the chairman to announce in a judicious manner that, since the available time for the first paper was exhausted, oral comment must be reserved until the close of the meeting.

Need it be remarked that the endurance of the audience was long passed by the time the *written* discussion on the last paper was completed, and those interested in the first had straggled out to lunch, for a walk in the fresh air, or for informal discussion in the lobbies?

SPECIALIZATION in training was urged 30 years ago by the makers of technical school curricula. Graduates were turned loose upon industry who gloried in having prepared themselves in a single branch of engineering. Their deficiencies in cultural education often became glaringly evident, the most common lack being in the use of the King's English. Much has been done to change all this and that much more remains to be done is being recognized at a gratifying rate. The new president of Stevens Institute, Dr. Harvey Nathaniel Davis, has put himself among the leaders of the advance in advocating "one fundamental unspecialized curriculum in engineering," in which studies in literature, history, economics, civil government, philosophy and art would have a larger place than heretofore has been thought needful in the making of a Stevens engineer. It is cheering to know that particular attention will be given to developing expression—an art in which the average graduate of our technical institutions has been all too backward.

CORRESPONDENCE

Making Open-Hearth Bottoms

To the Editor—It might interest your readers to know how the writer makes bottom in 50 and 75-ton basic open-hearth furnaces. When we construct a furnace and put it in operation, we proceed in making the bottom and side walls as follows:

First we take steel turnings, low in phosphorus and sulphur, put them on a pile and set them on fire. As a rule turnings carry from 150 to 200 lb. of oil to a ton, which is enough to burn them to synthetic iron. In large quantities of turnings one may find solid pieces of almost pure iron at the bottom of the pile after burning, which can be thrown into the furnace to improve the heats. After the turnings are burned, we throw them into the mill and grind them into a powder, and proceed as follows:

We take eight parts of American or Austrian magnesite, one part of burned, powdered steel turnings and one part of good basic slag, put this in the mill and thoroughly mix it. Meantime we get the furnace hot enough

to set it up, and make bottom and side walls. We are careful not to use more at a time than the heat of the furnace will set up clear through.

We have found no trouble in making three 50-ton heats in 24 hr., averaging 25 gal. of 14-16 gravity oil to the ton of steel in the ladle. We use Wills fuel oil burners, which can be set to throw the hot-spot in the flame to any point in the furnace. We find that we can do away with the old type of reversing furnace, by keeping our ingoing air at the same temperature. The furnaces work more evenly, with less time to the heat and better control.

Good Welded Joints

To the Editor: Your editorial in the issue of Dec. 6, entitled "What Makes a Good Joint," clearly points out that production control is necessary for satisfactory results. I would like to carry this thought a step further to emphasize the fact that welders who are on production, i.e., doing repetitive work, are much more easily and quickly trained than though they were to handle a variety of occasional repairs.

The situation is paralleled by machine work. Back in

the days before Henry Ford had made his first million (cars or dollars) a workman was not considered a machinist until he had served a long and comprehensive apprenticeship. Then came mass production and with it division of labor and specialization. Today it has reached the point well typified in the familiar anecdote of the father who expressed pride in his son's advancement in one of the large automobile plants. "Why," he told a friend, "Jimmy used to tighten nut 42 but now he tightens nut 187!" Those who admire craftsmanship lament the passing of the old order but the fact remains nevertheless that the new system is, and will continue to be, an important factor of industrial life.

Welding now is experiencing an exactly parallel transition. It is a change that should be welcomed rather than deplored, for it means that welding is accepted as a mass production tool. When welding was merely a method of repair, it was necessary for a man to gain long experience on a wide variety of metals and types of work before he could be considered qualified as a welder. That is, he had to learn a trade.

When considering welding as a production method many manufacturers fail to realize these facts. They immediately raise the objection "Where can we get welders?" The answer is shown by experience: Operators can be trained

for repetitive work in a fraction of the time necessary to develop an all-round welder. In fact, several years' experience in the production of oxwelded pressure vessels has shown that green men are to be preferred, for they can be trained from the start in the procedure that has been determined to be correct for this work and it is not necessary for them to "unlearn" anything. A second striking instance of this proposition is described on page 1293 of your issue for Nov. 22, showing how Servel, Inc., was able to train over a hundred men and girls to make welds in steel tubing for domestic refrigerators that passed a pressure test of 900 lb. per sq. in.

The welding of piping, rapidly becoming so important in the heating and plumbing field, is another operation that can be taught with entire satisfaction in a relatively short time. The degree of training and skill necessary naturally increases for higher steam pressures but in no case does the time of training impose a handicap on obtaining efficient operators from average labor.

The problem of obtaining welders for production work is thus relatively simple and a realization of this should lead to an ever increasing number of manufacturers to adopt this modern method of joining metals.

Research Is First Need in Marketing

(Concluded from page 1503)

tific management in production would have been long delayed if it had not been for the invaluable assistance of cost accounting. Few businesses do not now have a problem of hastening the development of cost accounting in marketing so that it may proceed with its major problem of marketing control.

More Flexible Budgets Needed

Based on past results many companies have decided to spend 10 per cent on selling and 3 per cent on advertising and the budget is the apportioning of the lump sums thus arrived at to various classes of expense. This might be called the restrictive budget. Good commercial research would bring out definite objectives for a sales period or a campaign and would enable a definite written plan for the activities necessary to attain the objectives. This plan would call for certain assigned activities on the part of individuals which would create expenses. With this start a budget might be built up from study of these projected activities. This might be called a constructive budget. If the final budget called for more money than the executives were willing or able to appropriate, the initial plan would be modified. This would help decide what to omit from the complete structure and would make for better judgment than would have been possible without the complete plan first. Perhaps in many cases the advisability of making an investment in the manner described of setting the excess expense as a deferred charge to be amortized over a period of time might be considered.

Soon larger use of the flexible budget idea will be made, so that field executives can control the scope or character of activities on the basis of certain day by day figures while the activities are in progress. No amount of historical figures can match this method of keeping informed of the profit angle of the work being done.

Training and Compensating Salesmen

Most marketing managers will agree that new or junior salesmen need sales training, although relatively few actually carry out their belief. That the tried senior sales-

man also needs training is recognized as a problem by few. As a road gets older, ruts appear and it must be scraped and rolled and re-surfaced if it is to be kept in good condition. Ruts appear as men grow older and they are prone to consider their education as finished. In successful lives, training never ceases, and more marketing managers should put training into their schedule of operations.

Many methods have been tried and many found wanting in the human problem of proper compensation. Compensation should not merely be payment for work done; it should also be stimulation to do the work yet undone. A solution may depend upon borrowing from production its knowledge and use of the task and bonus plan with its measurements and incentives.

Hoover's Final Report As Commerce Secretary

Some of the appendices contain much of the most interesting reading in the annual report of the Secretary of Commerce for the fiscal year ended June 30. An economic review showing volume of business quantities in manufacturing, minerals, forestry, building construction, electric power production, railroad traffic, etc., and value of sales in various types of wholesale and retail trade are given for a period of seven years in comparative figures. General wholesale price indexes, gross incomes of farms, banking and finance and foreign trade make up parts of the general review.

Following this are an article showing the general progress and tendencies in our foreign trade, another illustrating progress of national efficiency in output per worker, a third on elimination of waste, including the waste of human life or limb, an article on advance in standards of living, giving indicators of material progress at intervals since 1914, and one on commercial aeronautics. These add specific information on a number of significant topics connected with our national well-being.

Practically all of this type of information has been developed in usable form under the leadership of Hon. Herbert Hoover, who was Secretary of Commerce throughout the period surveyed. It is a brand of service not theretofore enjoyed by American business and one which has high possibilities for future expansion.

Iron and Steel Markets

Steel Output Holds at High Rate

Year-End Decline in Production Likely to Be Small—Active
First Quarter in Sight—Scrap Rises—
Wire Products Advanced

STEEL production is exceeding expectations as the year-end approaches, and the business outlook for the early part of 1929 is promising. Tapering specifications for some products, such as bars, shapes, sheets and strips, are offset, in part, by releases of rail and tin plate tonnage.

Ingot output at Chicago, as a result of greater pressure for rail shipments, has risen a number of points to 83 per cent of capacity, an average that is expected to hold for the rest of the year. Operations in the Greater Pittsburgh district, although likely to decline during the holiday season, have as yet shown no deviation from the 80 per cent rate of recent weeks. The average for Steel Corporation subsidiaries, at 83 per cent, is also unchanged.

Taking into account that these estimates usually err on the conservative side, as was the case in November, output for this month will probably set a new December record and it may prove surprisingly close to the November daily average.

The lack of price incentive, rather than any noticeable change in the volume of consumption, accounts for the decline in specifications and new business in some products. Apparently a tendency to buy at shorter range, together with heavy shipments, was an important factor contributing to the November decline of 78,000 tons in the Steel Corporation's unfilled orders—the first decrease since July. The total on Nov. 30, however, was 218,500 tons larger than on the same date one year previous.

Reduced specifying has occurred particularly in bars, plates and shapes. With no higher prices announced for first quarter, buyers see no reason for heavy last minute releases against current contracts, nor are they in haste to cover for the coming quarter.

In sheets, which have been advanced \$2 a ton, a fair amount of forward contracting has been done, but specifying has been cautious. Failing to induce mills to delay shipments until January, many sheet buyers are waiting until the mid-month deadline, thus to prevent, if possible, pre-inventory deliveries.

In tin plate the technical position of the market has resulted in a sharp rise in production, operations now averaging 87 per cent, compared with 70 per cent a month ago. The announcement of a price of 10c. more a base box released liberal specifications for 1929, and brought in considerable spot business.

Railroad demand is also expanding. At Chicago, largely because of liberal rail and accessory bookings, sales in the past two weeks were equal to those for any 14-day period this year. New rail purchases include 88,000 tons for the Baltimore & Ohio and 50,000 tons for the Missouri Pacific. Specifications for steel re-

quired in cars recently purchased are beginning to reach the mills, and the outlook for further freight equipment buying has been brightened by fresh inquiries, among them 3000 cars for the Missouri Pacific, 1000 for the Lehigh Valley and 500 for the Chicago Great Western. Adding the pending equipment purchases of the Santa Fe, Louisville & Nashville and the Rock Island, more than 15,000 cars are now in the market.

Steel demand from the automobile industry promises to rebound sharply in January. Motor car builders, although at present curtailing operations as inventory-taking approaches, are planning large production schedules for the first quarter. Chicago reports that automobile parts makers are already taking larger quantities of steel.

A recovery of strength in scrap prices is also regarded as an augury of a more active steel market next year. Heavy melting steel at Pittsburgh has advanced 75c. a ton to \$17.75, or within 25c. of its peak in October.

Prospective structural steel work is of growing proportions. Out of 58,000 tons added to pending projects this week, 34,000 tons is for New York subways and 10,000 tons for a Government building at Washington.

Farm implement plants continue to take more steel, although according to current estimates they have consumed 60 per cent more steel this year than in 1927.

A policy intended to protect the position of the jobber is seen in the announcement of an advance on wire products that introduces a new method of quoting. Under this plan, which applies to all items except woven wire fencing and wire rods, base prices will apply on shipments to retailers and consumers who buy in carload lots and jobbers will be given a preferential of \$2 a ton. The method, similar to that used by makers of pipe and bolts, nuts and rivets, reverses the former practice of quoting base prices to jobbers and attempting to obtain an advance of \$2 from other carload buyers. While the new quotations are \$4 above previous base prices, they represent an increase of only \$2 to jobbers.

Another price adjustment affects charcoal and lap-welded steel boiler tubes, which after Jan. 1 are to be sold on the basis of weights and price lists used by manufacturers of seamless boiler tubes. A new schedule of discounts has been published.

Ingot production in November, 4,259,380 tons, was the highest ever recorded for that month. Output for the 11 months was greater than for any previous 12 months except 1926.

THE IRON AGE composite price for finished steel has advanced from 2.362c. to 2.391c. a lb., the highest figure in 22 months. The pig iron composite remains at \$18.59 a ton.

Pittsburgh

Steel Business Sufficient to Maintain 80 Per Cent Operation —Advance in Heavy Melting Steel

PITTSBURGH, Dec. 11.—Specifications against existing contracts for finished steel are still coming along in volume sufficient to sustain an ingot production of approximately 80 per cent of capacity for this and nearby districts. But in most products shipments on old commitments are exceeding fresh purchases and signs point strongly to some recession in plant engagement during the holiday season.

With specifications for early 1929 requirements and some prompt buying to escape the advance in prices that becomes effective on Jan. 1, tin plate mills are having an exceptionally high rate of operation. Independent capacity is fully 90 per cent engaged, and it is estimated that close to 87 per cent of all mills now are in production. Rail mills also are busier and taking more steel. On the other hand, scheduling of bar, sheet and strip mill operations is becoming a little more difficult with backlogs running down and fresh buying light.

First quarter contracting is proceeding with less speed than would probably be the case if materially higher prices were proposed in bars, plates, shapes and cold-finished steel bars. Fourth quarter prices are continued into the first quarter and therefore coverage merely becomes an extension of existing arrangements. There has been a fairly good amount of contracting for the next quarter in sheets, but in hot-rolled

strips the report still is that several of the large buyers have yet to cover their needs for the period. It is said that buyers and sellers are apart on prices, with buyers resisting the demands of the mills.

Since a week ago, almost all producers of wire and wire products have adopted a new price schedule announced late last week by a large Pittsburgh manufacturer. This schedule sets up an advance of \$2 a ton

on all products except woven wire fence and wire rods on first quarter contracts. It also seeks to establish a new mode of quotation in that announced prices refer to carloads to other than jobbers.

Effective Jan. 1, makers of charcoal iron and lapwelded steel boiler tubes are adopting the weights and price lists used by manufacturers of seamless boiler tubes as the basis of a new list of discounts. On carload lots, lapwelded steel boiler tubes will be almost on the same basis as hot-rolled seamless tubes; the difference will be in the supplementary discount, which is 5 per cent on the latter and two fifths on the lapwelded tubes.

Primary materials are featured by a sharp rally in the price of heavy melting steel scrap. At least two local melters have paid \$18 for that grade, while even more was paid for offerings in a railroad list awarded late last week. Dealers with short orders to cover have become disturbed by the scantiness of offerings and the situation in the Youngstown and nearby districts has become very strong, since expected relief in large shipments from the Detroit district with the closing of Lake navigation has failed to materialize. Automomo-

bile production declined with the ending of Lake shipping season and with it the production of scrap. Even higher prices are mentioned on first quarter tonnages.

Pig Iron.—The pig iron market, so far as the immediate Pittsburgh district is concerned, is dull and not very steady. Melters are drawing against supplies under contract, and the most active merchant furnaces are shipping more than they are producing, but new business, influenced by inventory considerations, runs chiefly to carload lots. The Westinghouse Electric & Mfg. Co., in the market for foundry, silvery and Bessemer irons for its requirements over the first half of next year, has not yet closed and is reported to have a lower price on the foundry iron than \$18, Valley furnace, for the base grade. No great trouble is experienced in getting that price on small lots, and most of the current inquiries are of that character. A Pittsburgh district steel maker was able to place about 3000 tons of basic iron for December-January-February delivery at less than \$17.50 at Valley furnace, but the deal is not believed to have involved any Valley iron. This grade, however, now is available from several sources at \$17.50, Valley furnace, and a buyer of several weeks ago recently added to the original purchase at that price. Struthers furnace, Struthers, Ohio, will be started Dec. 12, after a long suspension.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.50
Bessemer	\$18.25 to 18.50
Gray forge	17.50
No. 2 foundry.....	18.00
No. 3 foundry.....	17.50
Malleable	18.25 to 18.50
Low phos., copper free....	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Hot-Rolled Flats.—Buyers of strips are specifying steadily on old orders, but do not find it necessary to make new purchases. First quarter contracting has not assumed large proportions. Several of the large automobile manufacturers have yet to close for their first quarter needs, and producers report considerable resistance to price from that direction.

Cold-Rolled Strips.—There is a fairly heavy run of specifications on this quarter's contracts, also a fair amount of advance buying. Prices are holding well at 2.85c., base Pittsburgh or Cleveland, and an effort still is being made to obtain 2.95c., base, from buyers whose orders generally are for small lots and whose specifications are rather exacting.

Semi-Finished Steel.—Users have until the end of the month to enter specifications on fourth quarter contracts and this condition probably accounts for a paucity of contracts for the first quarter. January requirements can be specified from this quarter's commitments. Sheet bars are held \$1 a ton higher for the next quarter than in this quarter, but no advance is sought on billets and slabs. Current specifications are steady, but the volume is somewhat less than it was recently, in keeping with the fact that the demand for the finished products is less urgent with the approach of the end of the year. An advance of \$2 a ton on wire products on first quarter contracts does not include wire rods, which remain at \$42, base Pittsburgh or Cleveland.

Bars, Plates and Shapes.—In view of the fact that present contract prices of these products hold for the first quarter of 1929, it is not surprising that the market is rather quiet, both as to current and first quarter purchases. There is no price incentive for specification of unshipped fourth quarter tonnages, and business for the first quarter suffers somewhat from the fact that unspecified tonnages for this quarter will become part of first quarter contracts. Releasing of tonnages is well under the rate of October and November, but has not dipped as low as was expected, because there has been no accumulation of stocks in second hands and requirements as they develop quickly are reflected in demands upon the mills. It is said that the mills are meeting with some success in raising prices to the very large consumers of bars, and that 1.90c., base Pittsburgh, will be more truly a

minimum in the new quarter than it has been in this quarter. It is probable that mills also will seek more money on specific structural steel jobs which usually are given preferential price treatment. Fabricated steel awards to shops in this district still are few, but inquiry is reported better.

Rails and Track Supplies.—Track accessories orders still lag behind those for standard-section rails. Old orders are pretty well worked out. Increased production of standard-section rails is immediately ahead, as most of the roads accept shipments during the winter to be able to take advantage of the first break in the weather in the spring. The list of spike makers in this and nearby districts has been considerably augmented in the past year, but prices hold despite the increased competition.

Wire Products.—One large producer, under date of Dec. 5, announced the withdrawal of all prices on plain wire, wire nails and other wire products except those on woven wire fence and on the same date announced its prices on first quarter contracts. The new schedule calls for an advance of \$2 a ton over this quarter's prices and also marks a change in the mode of quotation in that the prices are to "carload buyers," instead of "to jobbers in car lots," as formerly. Several other manufacturers since have adopted the new schedule and plan of quotation. For several months the mills have had a nominal extra charge of \$2 a ton on nails and wire to buyers other than jobbers, but it has not been uniformly or regularly exacted. This arrangement was intended to give the jobber, who buys to sell again, an advantage over retailer or consumer, and apparently it is now intended to give the plan full application in the first quarter. While the mills will continue to regard as entitled to direct mill service a few large users, it appears to be part of the plan to divert smaller business to the jobbers by quoting as high a price on carloads to retailers and small consum-

1923	30.86,	Mar. 20;	20.77,	Nov. 20	

ers as would be quoted by jobbers. The new prices "to carload buyers" are \$2.75, base, per keg, Pittsburgh, for bright nails; \$2.75, base, per 100 lb. for coated nails; \$2.60, base, per 100 lb. for bright wire, and corresponding prices for galvanized wire, barbed wire and staples, with the former differentials retained as to other basing points. These prices are \$2 a ton above what would have been obtained on the basis of former jobbers' carload prices plus the extra of 10c. per 100 lb. No reference is made to jobbers' carload prices, but it is assumed they will take a range 10c. per 100 lb. below the new schedule, or \$2.65, base, per keg, for nails and \$2.50, base, per 100 lb. for plain wire. The less-than-carload extra charge remains as formerly at 25c. per 100 lb. over the carload price.

Tubular Goods.—The demand for pipe is steady rather than active. In a general operation of not more than 70 per cent of capacity, the best showing is among the large lapwelding furnaces, which have a good complement of line pipe, and in seamless mills, which reflect the fact that much of the oil country pipe now called for is for deep wells and pipe of great ruggedness is required. Butt-welded pipe reflects in demand the fact that this is the low point of the year in building and construction and also that jobbers do not want to add to their inventories just now. Makers of charcoal iron and lapwelded steel boiler tubes are to put into effect a new method of quotation, which is given in detail elsewhere.

Sheets.—The market now appears fully established at the first quarter prices announced several weeks ago. Except possibly on blue annealed sheets, neither orders nor specifications can now be taken for shipment between now and the end of the month, and the mills are quite generally imposing the first quarter prices on shipments to be made next

month. Users of automobile body sheets still are trying to get the mills to defer shipments on remaining fourth quarter tonnages beyond the year-end inventory date, and some of the same tendency is noted among consumers of other kinds of sheets, but commonly the mills are insisting upon shipment with the completion of orders and for specifications by Dec. 10 by one company and Dec. 15 by others on remaining fourth quarter contract tonnages. Shipments of the American Sheet & Tin Plate Co. this year will be the largest, with one exception, in the history of the company. Its combined sheet and tin plate shipments will set an entirely new high record.

Tin Plate.—Mill operations still are rising, notably those of the independent makers, two of which are running all of their mills, while another will next Monday put on a 12-mill unit, which has been idle for the past two months or so. Early 1929 requirements are being specified freely and there is some buying for early shipment by consumers who want to avoid the higher prices applying on first quarter and half contracts. This year will run in shipments well ahead of last year, but will not quite reach the total for 1926.

Cold-Finished Steel Bars and Shafting.—While some makers had somewhat heavier releases against contracts in the past week as compared with the previous week, the market still is best described as moderately active. Getting buyers under contract for the first quarter is not proving difficult; the fact that the prices remain unchanged means that not much price resistance is developing and there will be some unspecified fourth quarter tonnage to carry over.

Coke and Coal.—Spot furnace coke is commonly selling at \$2.75 per net ton, Connellsville ovens, and while occasional small-lot sales occur at a slight advance, the coke is not for blast furnace use. Producers are scaling production in keeping with the fact that demand is light; in view of the taking up of the excess production through resumptions by two or three blast furnaces between now and end of the month, it is believed a stronger spot situation is ahead. There is much first quarter and first half contracting in foundry coke at unchanged prices. The spot foundry coke market is amply supplied, however, and prices are no more than steady. The coal market is so weak that a number of mines have been obliged to suspend production because of the losses which present selling prices entail.

Old Material.—The market has developed renewed strength in heavy melting steel in the past week. Light offerings of this grade have made dealers with short orders to cover a little nervous, and on top of that came the award of a railroad list; the heavy melting steel and scrap rails were sold direct to a mill at \$17.50, while another railroad list developed a price

of \$18.25, delivered this district, for the heavy melting steel. The market appears in one week to have regained much of its decline of the previous month or so. Still higher prices seem probable, as in addition to dealer interest in supplies, several steel manufacturers are negotiating for first quarter coverage. Dealers seem indisposed to sell for that delivery at less than \$18, delivered this district, while in Youngstown the asking price is \$19. Machine shop turnings have had a sharp advance since last report, sales being reported up to \$13, although the purchaser immediately after buying imposed a suspension upon shipments, and there is doubt that this price could be repeated. The low side of the range on heavy melting steel is \$17.25, which dealers are paying for small lots.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$17.25 to	\$18.25
Scrap rails.....	17.50 to	18.00
Compressed sheet steel....	17.50 to	18.00
Bundled sheets, sides and ends	16.00 to	16.50
Cast iron carwheels.....	15.00 to	15.50
Sheet bar crops, ordinary..	17.00 to	17.50
Heavy breakable cast.....	13.00 to	13.50
No. 2 railroad wrought...	17.25 to	18.25
Hvy. steel axle turnings..	15.00 to	15.50
Machine shop turnings....	10.50 to	11.00
Acid Open-Hearth Grades:		
Railr. knuckles and couplers	18.50 to	19.00
Railr. coil and leaf springs	18.50 to	19.00
Rolled steel wheels.....	18.50 to	19.00
Low phos. billet and bloom ends	20.50 to	21.00
Low phos., mill plates....	19.00 to	19.50
Low phos., light grade....	18.00 to	18.50
Low phos., sheet bar crops	19.00 to	19.50
Heavy steel axle turnings..	15.00 to	15.50
Electric Furnace Grades:		
Low phos. punchings.....	18.50 to	19.00
Hvy. steel axle turnings..	15.00 to	15.50
Blast Furnace Grades:		
Short shoveling steel turnings	12.00 to	12.50
Short mixed borings and turnings	12.00 to	12.50
Cast iron borings.....	12.00 to	12.50
Rolling Mill Grades:		
Steel car axles.....	20.00 to	21.00
No. 1 railroad wrought...	13.00 to	13.50
Sheet bar crops.....	17.25 to	18.25
Cupola Grades:		
No. 1 cast.....	14.50 to	15.00
Rails 3 ft. and under....	17.50 to	18.00

Detroit Scrap Market is Slightly Weaker

DETROIT, Dec. 11.—Prices on old material in the district have not changed in the past week, and, while there is some tendency toward a slight weakness in the market, this has not materialized to affect prices downward.

Shipments of pig iron are somewhat below November figures, but not to the extent that furnaces serving the district will be forced to pile iron during the month.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$13.00 to	\$13.50
Borings and short turnings	9.00 to	9.50
Long turnings	8.50 to	9.00
No. 1 machinery cast....	14.00 to	15.00
Automobile cast	19.00 to	20.50
Hydraul. comp. sheets....	12.25 to	12.75
Stove plate	11.00 to	12.00
No. 1 busheling	11.00 to	11.50
Sheet clippings	8.00 to	8.50
Flashings	11.50 to	12.00

Warehouse Prices, f.o.b. Pittsburgh	
	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes...	2.90c.
Reinforcing steel bars.....	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons.....	3.60c.
Squares and flats.....	4.10c.
Bands	3.60c.
Hoops	4.00c. to 4.50c.
Black sheets (No. 24), 25 or more bundles	3.70c.
Galv. sheets (No. 24), 25 or more bundles	4.55c.
Blue ann'l'd sheets (No. 10), 1 to 10 sheets	3.35c.
Galv. corrug. sheets (No. 28), per square	\$4.43
Spikes, large.....	3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.

Upset set screws.....	80, 10 and 5
Milled studs	70

Chicago

Steel Mill Output Gains to 83 Per Cent and Orders Assure This Operation for Remainder of Year

CHICAGO, Dec. 11.—The Inland Steel Co. has blown in its No. 1 blast furnace, bringing the total number of steel mill stacks in active service to 24 out of 36 in the district. In October and November 23 were in blast. A merchant furnace at St. Louis also has been lighted. That pig iron capacity in the Chicago district is not now considered excessive is indicated by contemplated new construction, which includes two steel mill stacks and the rebuilding to larger capacity of a local merchant furnace.

Releases against steel contracts are in such volume that the present rate of ingot output seems assured for the remainder of the year. With production at 83 per cent, a gain of several points in the week because of heavier demands for prompt delivery of standard-section rails, sellers are slowly using up cold iron.

Total tonnage of ore, limestone and coal passed over Chicago steel mill docks in 1928 will establish a record for all time.

Following the lead by producers east of here, Chicago mills have named 2c. to 2.10c. per lb. for plates, shapes and bars to be delivered in the first quarter. Inquiry is brisk, which is taken by the trade as a reflection of consumers' estimate of general business in the early part of the new year.

Sales, including rails and track accessories, are a trifle larger than in the previous week, making the past two weeks the equal of any 14-day period this year.

Automobile parts manufacturers are setting a faster pace, and the steel industry already is feeling the impulse of the greater activity. Automobile building usually lags about 30 days behind the first improvement in specifications and orders from parts makers. Automobile frame makers are taking larger quantities of hot-rolled strip.

Pig Iron.—The Chicago market remains steady at \$20, notwithstanding that sales of boat iron and off grades from steel mills are reported at lower quotations. Sales, as gaged by recent weeks, are light, partly because of the lower foundry melt usually experienced during the holiday season and also because of the fact that most consumers are well covered for the remainder of the year. Malleable foundries are operating at close to capacity and occasionally find need of small additional purchases to meet immediate requirements. On the whole, the local foundry melt is well sustained. Silvery prices are not stable. Some producers recently named advances of \$1 a ton, while others asked increases of \$2. In the week sales have been made at prices prevailing before the advances.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25...	\$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75...	20.50
Malleable, not over 2.25 sil.....	20.00
High phosphorus.....	20.00
Lake Super. charcoal, sil. 1.50.....	27.04
So'th'n No. 2 fdy. (all rail) ..\$22.51 to	23.01
Low phos., sil. 1 to 2, copper free..	29.50
Silvery, sil. 8 per cent.....	30.79
Bess. ferrosilicon, 14-15 per cent...	47.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet from the standpoint of sales. Shipments are going forward at an undiminished rate.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegel-eisen, 19 to 21 per cent, \$40.76.

Coke.—Forward contracting for the first half of the new year is practically completed at \$8 a ton, local ovens. Shipments remain at the high rate reached earlier this month.

Bolts, Nuts and Rivets.—Inventory taking has further reduced the total volume of specifications. Producers continue to hold to 65 per cent of output, and are stocking the margin between production and shipments.

Wire Products.—Western producers of these commodities are announcing advances of \$2 a ton, effective immediately. The usual differential of 25c. per 100 lb. for less than carload quantities will be continued, and terms are 2 per cent for cash in 10 days on mill invoice value of material. In naming new prices the leading producer is using dealers' quotations at \$2.80 for nails and \$2.65 per 100 lb., Chicago, for plain wire. The general practice of the trade, however, is to name carload prices to jobbers at \$2.75 for nails and \$2.55 for plain wire, representing a \$2 advance over recent quotations to the jobbing trade. Shipments from Western wire mills are steady, and output is close to 65 per cent of capacity. Little effort is being put forth by sellers to accumulate stocks. Inquiry from the manufacturing trade is more active, especially from automobile parts makers which are anticipating a rise in demand for their products soon after the turn of the year. Specifications are lighter from some sources because of the inventory period. The jobbing trade is unchanged except in the Northwest, where business slows down as severe winter weather approaches. Prices for wire and wire products are given on page 1527.

Sheets.—Prices are stronger. Local producers are accepting first quarter contracts at 2.25c. per lb., Chicago, for blue annealed sheets, 3c. for black and 3.75c. for galvanized. Forward contracting is more active, but users are conservative and the full swing of a buying movement has not yet been felt by producers. Specifications

in the first 10 days in December are measurably ahead of the corresponding period in the preceding month. Releases against old orders are coming from a wide circle of users, but individually they are smaller than a week ago. Output is steady at 80 per cent of capacity, and deliveries are from three to four weeks on galvanized, two to three weeks on black and two weeks on blue annealed. Roofing sheets may be had promptly.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.00c.; No. 24 galv., 3.75c.; No. 10 blue ann'd, 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Hot-Rolled Strip.—Automobile parts makers are entering heavier specifications for material that will be needed soon after the turn of the year. Several local mills are operating at capacity. Prices are steady at 2c. per lb. for hot-rolled strip wider than 6 in.

Cast Iron Pipe.—Winter buying is gaining momentum. Milwaukee will close Dec. 28 on 9000 tons of 6 to 16-in. Class C pipe and 450 tons of fittings. Racine, Wis., is in the market for 1800 tons, and several other municipalities in Wisconsin will soon come into the market. A contractor's job in Cincinnati will take 300 tons of 6-in. pipe. Inquiries in Illinois, Indiana and Western Michigan are slow in developing. The United States Cast Iron Pipe & Foundry Co. bid \$41.42 a ton, delivered, on 6000 tons of 24 to 48-in. pipe at Detroit. This figures back to \$33.50 a ton, Birmingham. A foreign maker bid \$39.90 a ton, delivered, on the 36-in. size. Other delivered quotations were \$42.25 by the American Cast Iron Pipe Co. on 1000 tons of 24-in. and \$40.65 by James B. Clow & Sons on 750 tons of 24-in. pipe. Prices have not been tested in the local market.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$46.20; 4-in., \$46.20 to \$50.20; Class A and gas pipe, \$4 extra.

Structural Material.—Awards during the week totaled 5000 tons, and fresh inquiry is for 1500 tons and an unstated amount of steel for an office building in Chicago for Swift & Co. Recent estimates of the steel needed for the Chicago Board of Trade Building now place the figure at 18,500 tons. Local shops are well engaged, but books have been greatly reduced during the late fall weeks of inactive buying. Producers of shapes are accepting first quarter business at 2c. to 2.10c. per lb., Chicago.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Rails and Track Supplies.—The Baltimore & Ohio has closed for 88,000 tons of standard-section rails for delivery in 1929. This tonnage was divided among the Bethlehem Steel Co., Carnegie Steel Co. and the Inland Steel Co. Included in this business is 3000 tons for the Baltimore & Ohio Chicago Terminal. The Missouri Pacific has ordered 50,000 tons

of rails and a round tonnage of track accessories. Fresh inquiry for rails from Western railroads total 50,000 tons. Orders for track accessories total 20,000 tons and inquiry totals 18,000 tons. Output by local rail mills is heavier, not because of the opening of the 1929 rail-rolling program, but due to releases of tonnages not expected by producers. The iron tie plate market is quiet. Light rails are moving only in car-load lots.

Prices f.o.b. mill, per gross ton: Standard-section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Plates.—Of foremost interest in this market is an inquiry from the Missouri Pacific for more than 3000 cars, requiring in all not less than 38,000 tons of steel. The Missouri Pacific and the Chicago & North Western are in the market for locomotives. Specifications for car materials are reaching mills. The total volume to date, though small, is having an effect on rolling schedules, which have been gradually creeping ahead for the last two weeks. Many miscellaneous buyers, anticipating requirements after the turn of the year, are now making known their wants, which tend further to obligate local plate mills. Western Oil refiners are seeking 10,000 tons of plates for oil storage tanks. Although official announcements have not been made, it is known that local producers are accepting first quarter business at 2c. to 2.10c. per lb. Forward contracting has assumed fair proportions.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Tin Plate.—Prices are steady, and forward contracting is moderately active. Specifications against old low-priced contracts are heavy and hold mills close to capacity output.

Bars.—Demand for mild steel bars is turning upward. Shipments have grown a trifle in the week, and bar mill schedules are extended. Automobile parts makers, whose needs for

steel come three to four weeks ahead of the demands from automobile manufacturers, are specifying in larger quantities, and they have arranged shipping schedules well into January. Several Chicago mills are operating at capacity, and deliveries are not better than three to five weeks. Farm implement manufacturers continue to expand production facilities, and they are taking increasing tonnages of steel. Some observers estimate that steel used in farm implements in 1928 will exceed by 60 per cent that used in the preceding year. First quarter business in soft steel is being taken at 2c. to 2.10c. per lb. A liberal number of specifications for alloy steel bars for delivery after the turn of the year have come to producers. Forward contracting continues at a fair rate. Demand for iron bars is light. Forward buying of rail steel bars at 1.95c., Chicago Heights, is active. Current specifications are fully equal to output.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Reinforcing Bars.—Dealers are engaged in trying to close old quotations before Dec. 15, which is the dead line on bids made prior to price advances on Dec. 1. New quotations on billet steel reinforcing bars out of Chicago warehouses are 2.35c. a lb. for orders of more than 18 tons, 2.60c. for 5 to 18 tons and 2.85c. a lb. for smaller lots. Fresh inquiry is moderately active, but for the most part in small tonnages. Shop operations average 50 per cent of capacity and deliveries are reasonably prompt.

Old Material.—A steel company has bought 20,000 tons of heavy melting steel at \$15 a gross ton, delivered, and another has bought a tonnage at \$14.50. Carlot sales of cast iron wheels have brought 25c. a ton above prices quoted. However, the demand for this grade is light and yards are overstocked. Considering the interest shown by users, carlot sales are scarcely indicative of the market as a whole. Foundry grades are active in small lots. Railroad malleable is scarce; consumers outside of Chicago are willing to pay more than local users for this grade.

Dealers continue to pay from \$15 to \$15.25 a gross ton for heavy melting steel to be delivered against old contracts. The supply of this grade is more liberal from most sources. The Santa Fe, the Illinois Central and the Chicago & Alton have lists to sell.

Prices deliv'd Chicago district consumers:
Per Gross Ton

Basic Open-Hearth Grades:
Heavy melting steel.....\$14.50 to \$15.00
Shoveling steel..... 14.50 to 15.00
Frogs, switches and guards, cut apart, and misc. rails 15.75 to 16.25
Hydraulic compressed sheets 13.00 to 13.50
Drop forge flashings..... 10.50 to 11.00
Forg'd, cast and r'd steel carwheels 17.75 to 18.25
Rail'd tires, charg. box size 17.50 to 18.00
Rail'd leaf spring cut apart 17.50 to 18.00

Acid Open-Hearth Grades:
Steel couplers and knuckles 16.00 to 16.50
Coil springs..... 18.25 to 18.75

Electric Furnace Grades:
Axle turnings..... 14.50 to 15.00
Low phos. punchings..... 16.50 to 17.00
Low phos. plate, 12 in. and under 16.00 to 16.50

Blast Furnace Grades:
Axle turnings..... 12.00 to 12.50
Cast iron borings..... 11.75 to 12.25
Short shoveling turnings.. 11.75 to 12.25
Machine shop turnings.... 8.00 to 8.50

Rolling Mill Grades:
Iron rails 15.00 to 15.50
Rerolling rails 16.50 to 17.00

Cupola Grades:
Steel rails less than 3 ft.. 17.25 to 17.75
Steel rails less than 2 ft.. 19.00 to 19.50
Angle bars, steel..... 16.50 to 17.00
Cast iron carwheels..... 14.25 to 14.75

Malleable Grades:
Railroad 16.50 to 17.00
Agricultural 12.50 to 13.00

Miscellaneous:
*Relaying rails, 56 to 60 lb. 23.00 to 25.00
*Relaying rails, 65 lb. and heav. 26.00 to 31.00

Per Net Ton
Rolling Mill Grades:
Iron angles and splice bars 14.50 to 15.00
Iron arch bars and transoms 20.50 to 21.00
Iron car axles..... 26.50 to 27.00
Steel car axles 15.50 to 16.00
No. 1 railroad wrought... 13.25 to 13.75
No. 2 railroad wrought... 13.00 to 13.50
No. 1 busheling..... 11.50 to 12.00
No. 2 busheling..... 6.00 to 6.50
Locomotive tires, smooth.. 13.25 to 13.75
Pipes and flues..... 9.50 to 10.00

Cupola Grades:
No. 1 machinery cast..... 15.50 to 16.00
No. 1 railroad cast..... 15.00 to 15.50
No. 1 agricultural cast... 14.50 to 15.00
Stove plate 12.25 to 12.75
Grate bars..... 12.50 to 13.00
Brake shoes..... 11.50 to 12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Warehouse Prices, f.o.b. Chicago

Base per Lb.

Plates and structural shapes..... 3.10c.
Soft steel bars..... 3.00c.

Aetna-Standard Acquires Tin Plate Pickling Process

YOUNGSTOWN, Dec. 11.—M. I. Arms, II, president Aetna-Standard Engineering Co., announces acquisition of American and Canadian rights to a new process in annealing and pickling tin plate, sheets and strip steel. The process, invented by William Hanby, London, England, metallurgist, will combine into one operation all the annealing and pickling processes now employed and it will reduce by 50 per cent the time required in such manufacture.

"Application of the new process will eliminate the necessity of expensive furnace installations now used

in annealing," said Mr. Arms. "The process can be adapted for continuous rolling. This is the first revolutionary change in the method of annealing and pickling tin plate, strips and sheets since the beginning of the industry."

Aetna-Standard engineers are now designing the machinery to be employed in the process.

The Aetna company is installing a new seamless pipe mill for the Timken Roller Bearing Co., Canton; is building complete equipment for eight new tin plate mills for the Columbia Steel Corporation, Pittsburg, Cal., and also has under way a new type expansion steel tube mill for the National Tube Co.

Philadelphia

Steel Buyers Slow to Make New Contracts—Pig Iron Buying Increases

PHILADELPHIA, Dec. 11.—Except for a small volume of forward buying by steel consumers who regularly contract for each quarter's requirements, few contracts have been closed for next year. Buyers seem satisfied that the present levels of 1.90c. to 1.95c., Pittsburgh, on bars; 2.05c. to 2.15c., Coatesville, on plates, and 2.05c., f.o.b. nearest mill to consumer, on shapes will be obtainable during the next quarter. This has developed a tendency among consumers to return to the former policy of buying material as needed. Specifications against last quarter contracts have diminished this month, and extension of present commitments into January is expected in many cases. Although prices for sheets in the next quarter show an advance, contracting lags and specifications to complete present commitments by the end of this month are light.

Pig Iron.—Occasional shading of the \$21 per ton first quarter price on foundry iron is reported, and in some cases requirements for next year have been placed with delivery specified to begin this month, so that the current delivery price of \$20.50 per ton would apply. Inquiry began to increase last week, and a number of desirable tonnages are in the market from eastern Pennsylvania consumers of foundry iron. The Lobdell Car Wheel Co., Wilmington, Del., is about to close on a carload of No. 2 foundry for prompt shipment and 300 tons of No. 3 foundry for January to March delivery. The Salem Brass & Iron Mfg. Co., Bridgeton, N. J., is inquiring for about 1500 tons of three grades for first quarter delivery, and the Ingersoll-Rand Co. is expected to enter the market this month for its first quarter requirements at Phillipsburg, N. J. Recent purchases have included 1500 tons of floor iron by the Baldwin Locomotive Works from a steel company furnace and 500 tons of foundry by the Sun Shipbuilding & Dry Dock Co., Chester, Pa., divided between two eastern Pennsylvania furnaces. The Standard Steel Works Co., Burnham, Pa., has closed on about 5000 tons of low phosphorus, of which 2500 tons will come from England and 2500 tons from an eastern Pennsylvania steel company.

Bars.—Consumers show little interest in covering their requirements for first quarter, apparently satisfied that they can buy during the quarter as their needs develop. Quotations range from 1.90c. to 2c. per lb., Pittsburgh, or 2.22c. to 2.32c., delivered Philadelphia.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	\$21.26 to \$21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X.	22.26 to 22.76
Basic (del'd east. Pa.)	20.25 to 20.75
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25	25.29
Va. No. 2X, 2.25 to 2.75 sil.	25.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Plates.—First quarter contracts are limited to the consumers who usually cover their requirements in advance. In many cases, buyers evidently intend to cover their needs as they arise. Quotations are unchanged at 2.05c. to 2.15c. per lb., Coatesville, or 2.15c. to 2.25c., delivered Philadelphia. Specifications against current contracts are light, and some extensions into the next quarter are expected. Mills expect some substantial tonnages early in the new year from shipbuilding contracts, on which bids are being submitted by shipyards.

Shapes.—Most of the current buying is at 2.05c. per lb., nearest mill to consumer, or 2.11c., delivered Philadelphia, based on Pencoyd, Pa. This price is shaded occasionally on desirable projects, but 2c., mill, is generally the minimum. Shipbuilding promises some good tonnages of shapes for next year. Elimination of grade crossings on the Reading Railroad at Manayunk will require 6000 tons or more of shapes.

Sheets.—Only a small number of first quarter contracts are reported closed, but black sheets are being maintained at 2.85c. per lb., Pittsburgh, or 3.17c., Philadelphia, and galvanized at 3.60c., Pittsburgh, or 3.92c., Philadelphia. Blue annealed sheets

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, ¼-in. and heavier	2.70c.
Plates, ⅜-in.	2.90c.
Structural shapes	2.70c.
Soft steel bars, small shapes, iron bars (except bands)	2.80c.
Round-edge iron	3.50c.
Round-edge steel, iron finished 1½ x 1½ in.	3.50c.
Round-edge steel, planished	4.30c.
Reinforc. steel bars, sq. twisted and deform.	2.60c. to 2.80c.
Cold-fin. steel, rounds and hex.	3.45c.
Cold-fin. steel, sq. and flats	3.95c.

Blue ann'd sheets (No. 10)	3.15c.
Diam. pat. floor plates—	
¼-in.	5.30c.
⅝-in.	5.50c.
Rails	3.20c.
Swedish iron bars	6.60c.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

have developed a slight tendency toward weakness in the narrower sizes, on which competition from continuous sheets is encountered, so that the market today is quotable at 2c. to 2.10c., Pittsburgh, or 2.32c. to 2.42c., Philadelphia, the lower price applying on sales of the narrow widths.

Warehouse Business.—Buying from stock has been better in the early part of this month than in the same period of November. On recent sales in Delaware, it is noted that the Philadelphia district size extras on bars and shapes, which are slightly higher than the mill differentials, have been applied.

Imports.—In the week ended Dec. 8, arrivals at this port consisted of 12 tons of galvanized steel strips from the United Kingdom, 9 tons of steel billets from Sweden and 29 tons of steel scrap, of which 21 tons came from Germany and 8 tons from the United Kingdom.

Old Material.—Except for the purchase of about 5000 tons of No. 1 heavy melting steel by a Claymont, Del., consumer and a similar tonnage by a Coatesville, Pa., mill, the market continues quiet. Yard grade has been bought by a Harrisburg, Pa., consumer at \$12 per ton, but shipments are still being made on contracts at \$12.50 per ton, delivered. Cast scrap still shows an undertone of weakness, but no sales are reported.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$15.00 to \$15.50
Scrap T rails	14.50 to 15.00
No. 2 heavy melting steel	12.00 to 12.50
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.00
Machine shop turnings (for steel works)	11.00 to 11.25
Heavy axle turnings (or equiv.)	12.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	15.50 to 16.00
Railroad grate bars	12.50
Stove plate (for steel works)	12.50
No. 1 low phos., hvy., 0.04% and under	19.00 to 20.00
Couplers and knuckles	17.50 to 18.00
Rolled steel wheels	17.00 to 17.50
No. 1 blast f'nace scrap	10.00 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	21.50 to 22.00
No. 1 forge fire	12.00 to 12.50
Cast iron carwheels	16.50
No. 1 cast	16.25 to 16.75
Cast borings (for chem. plant)	15.00
Steel rails for rolling	16.50 to 17.00

Nineteen New Airports

Intention of establishing municipal airports was announced in 19 more cities during the latter part of November, according to the Department of Commerce.

The Truscon Steel Co., Youngstown, has removed its Cincinnati office to 1200 Fountain Square Building, 505 Walnut Street. J. L. Fink is district manager.

Cleveland

Steel Orders Holding Up Fairly Well—Automobile Companies Planning Large First Quarter Schedules

CLEVELAND, Dec. 11.—While there is some slowing down in the demand for finished steel, orders are holding up fairly well in view of the fact that with the reestablishment for the first quarter of the present prices on steel bars, plates and shapes buyers have no special incentive to get in specifications on existing contracts, and they want to have stocks reduced as much as possible by inventory time. An increase in specifications is expected later in the month for material to be delivered after Jan. 1. Not much contracting for the first quarter has been done in steel bars, plates and shapes, as mills are not pressing buyers for contracts and the latter are in no hurry to make commitments.

Mills are holding closely to the prices they named for the last quarter on the three products, the range being 1.90c. to 1.95c., Pittsburgh, the 2c. price usually applying only to small-lot buyers who do not contract. On steel bars, outside mills, when using the Cleveland base, are generally quoting 1.95c., Cleveland, both for local delivery and for shipment to other points in the territory. However, outside mills are holding strictly to a Pittsburgh base for less than car lots. Local mills continue to quote steel bars at 1.90c., mill. Some recent shading of this price developed in business from the implement manufacturers in competition with rail steel bars, which are quoted at 1.85c., mill, for uses other than for reinforcing work. Most of the buyers of alloy steel bars have covered for the first quarter. Present prices on bolts and nuts and wire rods have been reaffirmed for the first quarter, but a \$2 a ton advance has been announced on wire products.

Steel orders from the Michigan territory are reflecting the slowing down of the automotive industry for inventories and the bringing out of new models, but a heavier demand is expected from that source late in the month for January shipment. Motor car builders are planning large production schedules for the first quarter. Local plants engaged in making automobile forgings and springs continue fairly busy, but stamping plants have curtailed operations, as some of the automobile companies are not releasing specifications. The Chevrolet Motor Co. is getting under production on its new models more slowly than was expected.

Structural inquiry is light. Railroads in this territory have not yet come in the market for their 1929 rail requirements.

Pig Iron.—The buying movement continues to taper off. Sales by Cleveland interests during the past week were 18,000 tons, compared with 32,000 tons the previous week. Most of the large consumers appear to be covered for the first quarter and some have bought for the first half. Not a great deal of inquiry is pending. Prices are firm and unchanged. Most sellers have good order books for the first quarter, so that competition for business at competitive points is not

as keen as it was in the early part of the year. Cleveland furnaces are holding to \$18.50 for foundry and malleable iron for outside shipment, and another Lake furnace remains on an \$18.50 base for western Ohio and parts of Indiana. In Michigan, the market is firm at \$20. Some effort is being made to establish a 50c. differential on malleable iron over foundry iron by some furnaces that have been selling both grades at the same price. Shipments have started out well for December, but are expected to slow down during the latter part of the month. One large consumer in the automotive field is taking more iron this month than in November. On Ohio silvery iron, \$26 appears to have become the general price for 8 per cent iron, although one producer is asking \$27 in some cases.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$19.50
S'th'n fdy., sil. 1.75 to 2.25	\$22.50 to 23.00
Malleable	19.50
Ohio silvery, 8 per cent	29.00
Basic Valley furnace	17.50
Stand. low phos., Valley	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Semi-Finished Steel.—Wire rods have been re-established for the first quarter at the present price of \$42, Cleveland and Pittsburgh. A local producer has made a few round-lot sales of sheet bars at \$34, Cleveland. This mill is asking the same price for billets and slabs, or \$1 a ton higher than the prices quoted by Youngstown mills, but has made no sales of these products for the coming quarter.

Wire Products.—A \$2 a ton advance on nails and wire and on all other wire products, except fence, has been made by leading producers, which are

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struct. shapes	3.00c.
Soft steel bars	3.00c.

No. 9 ann'l'd wire, per 100 lb.	\$2.85
No. 9 gal. wire, per 100 lb.	3.30
Com. wire nails, base per keg	2.85

*Net base, including boxing and cutting to length.

now quoting nails at \$2.65 per keg, Cleveland, and bright plain wire at 2.50c. per lb. Nails have been moving slowly, and the price advance may stimulate orders against outstanding contracts.

Fluorspar.—Some of the large consumers are negotiating for gravel fluorspar for next year. Producers are meeting with some price resistance to their recent \$1 a ton advance to \$18, mines, so that this price has not yet been established except on some small-lot sales.

Bolts, Nuts and Rivets.—Bolts and nuts have been reestablished at the present discount of 70 per cent off list for the first quarter and rivets have been established at the present prices for the coming quarter. Semi-finished hexagon nuts also have been reestablished at 70 per cent off list for the first quarter. Producers are now sending out contract blanks to their customers. Cap and set screws have been advanced 5 points, the new prices applying to current orders and to the first quarter. Railroad spikes have been reestablished at 2.80c., producing point. Large rivets are quoted at \$2.90 per 100 lb., Cleveland and Pittsburgh, and \$3, Chicago, and small rivets are 70 and 10 per cent off list at the three producing points.

Strip Steel.—Prices on hot-rolled strip have settled pretty generally to 1.80c., Pittsburgh, for material wider than 6 in. and to 1.90c. for 6 in. and narrower. There has been a moderate amount of contracting for the first quarter at these prices. Only small lots are bringing \$2 a ton higher prices, but the higher prices apply to very little contract tonnage. Cold-rolled strip contracts are being taken at 2.85c., Pittsburgh. A 2.95c. price applies to small lots and generally to consumers who do not contract. Specifications for both hot and cold-rolled strip have slowed down.

Sheets.—Specifications have declined, and some of the mills have reduced their backlogs considerably. Many consumers are evidently holding back orders against existing contracts until the deadline date, Dec. 15, with the expectation that mills will not make shipments until after Jan. 1 or after inventories. Many of the larger consumers probably will have enough material coming in at the old contract prices to last them through January. There has been a fair amount of contracting for the first quarter at the new prices, and mills have received liberal specifications for auto body sheets for January shipment, some being well filled up with that grade for next month. Mills able to accept orders for December shipment are still making sales at the old price, or \$2 a ton below the first quarter price. Some buyers are resisting the \$2 a ton advance on tin plate.

Warehouse Business.—Small-lot orders have fallen off, but jobbers report an increase of good-sized orders from buyers who need material for use during the remainder of the year

and who are turning to warehouses to take care of these early requirements.

Coke.—Domestic coke is moving a little better than recently. There is very little new demand for foundry coke, although specifications against contracts are holding up fairly well. Ohio by-product foundry coke is unchanged at \$7.75, Painesville, for December shipment.

Old Material.—The scrap market is firm but dull. There is no new consumer demand, and some of the mills are restricting shipments. Dealers are buying small lots at quoted prices to fill outstanding orders. They are able to pick up small lots of blast furnace scrap at \$11, or slightly higher, but would pay \$11.50 for round tonnages. While the demand for scrap has declined, the production also has fallen off somewhat owing to the slowing down of the automotive industry. In the Valley district, No. 1 heavy

melting steel is bringing \$16.50 to \$17 from dealers.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades		
No. 1 heavy melting steel.	\$14.50 to	\$15.00
No. 2 heavy melting steel.	14.00 to	14.50

New York

Subway Requires 34,000 Tons of Fabricated Steel—Interest in Pig Iron Diminishes

NEW YORK, Dec. 11.—Sales of pig iron in this district totaled 6000 to 7000 tons, or only about one-third of the bookings of the previous week. Interest in the market is plainly diminishing as the holiday and year-end shutdowns approach. Shipments, although not so large as during the season of navigation, when the barge movement was under way, are holding up to recent levels. Foundry melt is being maintained, and the fact that users are taking all the iron due them indicates that they have no inventory problem. Contracting for first quarter has not been so heavy in this district as in some other sections of the country. Possibly three-quarters of the buyers have covered their estimated requirements, and there is no rush on the part of the remaining consumers to enter the market. The only new first quarter inquiry of any size that has appeared is one from the General Electric Co. for about 4000 tons for its eastern plants, including those at Bayway, N. J.; Schenectady and Elmira, N. Y.; Pittsfield, Lynn and Everett, Mass. The Burnham Boiler Corporation, Irvington, N. Y., has bought 600 tons of foundry iron for first quarter shipment to its Lancaster, Pa., plant. The A. P. Smith Mfg. Co., East Orange, N. J., has placed 150 tons of foundry. Buffalo foundry iron continues to range from \$17.50 to \$18, base furnace. Eastern Pennsylvania foundry iron for delivery in this section is weak at \$20, base furnace. First quarter quotations on Dutch and Indian foundry iron are \$22 for No. 1X and \$21.50, base, duty paid. The ocean freight

rate on Dutch iron has been advanced 89c. to \$3.81 a gross ton.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	\$22.41 to \$22.91
*Buf. No. 2, del'd east.	
N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	20.89 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.39 to 23.02
East. Pa. No. 1X fdy., sil. 2.75 to 3.25	21.89 to 23.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Ferroalloys.—Sales of several lots of ferromanganese, totaling about 750 tons, for next year's delivery are reported. Quotations are unchanged at \$105, seaboard basis. Business in spiegeleisen is confined to sales of carloads and small lots and quotations are unchanged at \$34, furnace, for the 19 to 21 per cent alloy.

Reinforcing Bars.—The Carroll-McCreary Co., Inc., Long Island City, has been awarded 500 tons for a Pennsylvania Railroad bridge at Hackensack, N. J., and 200 tons for the Abraham Lincoln High School in Brooklyn. Several new projects of fair size are being figured, the largest being a building for the Hoffman Beverage Co. in Newark, calling for 800 tons, and two additional sections of the New York subways which will require about 750 tons. Prices are firm at 2c., Pittsburgh, for 40, 50 and 60-ft. lengths available for shipment direct from mill, and 2.25c., Pittsburgh mill warehouse, for the cut lengths. Out of New York warehouse, distributors are quoting 2.85c. per lb. for lots of

activity of October and November. Specifications for miscellaneous steel products are in fair volume, but new business is light. Plates are conspicuously dull, although some large tonnages are in prospect for early in the new year in shipbuilding and pipe lines. New York subway work is outstanding among pending fabricated steel jobs, bids having been called for on two sections of the Houston Street project requiring 34,000 tons of steel. A building for the Internal Revenue Bureau in Washington will take 10,000 tons. Among the larger awards of the past week was 5200 tons for a loft building at Seventh Avenue and Thirty-ninth Street. The Structural Steel Board of Trade of New York reports that lettings in the metropolitan district in November, exclusive of subways and bridges, were 27,500 tons, compared with 50,300 tons in October and 34,000 tons in November, 1927. As prices on plates, shapes and bars for the coming quarter are to be unchanged, contract buyers seem in no hurry to sign up for their forward requirements. Most of the steel companies' contracts require that specifications in full against fourth quarter contract shall be sent to the mills by Dec. 15, and it is expected that many buyers will provide for their January needs before making new contracts.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.22½c. to 2.27½c.; struc. shapes, 2.19½c. to 2.22½c., bar iron, 2.14c. to 2.24c.

Sheets.—Contracting for the first quarter has not been in large volume, but this is not surprising in view of the fact that many consumers will have sufficient tonnage coming to them on lower-priced fourth quarter contracts to provide for all or part of their needs in January. Some buyers are trying to escape shipment of their remaining fourth quarter tonnage until the last week of the month or early in January, but most mills insist on shipping at their earliest convenience.

Cast Iron Pipe.—Quotations of Northern makers of pressure pipe have shown further advances recently, and the market is now quotable at \$39.60 to \$40.60 per net ton, delivered New York. Inquiries are mostly for small tonnages. Yonkers, N. Y., opens bids Dec. 13 on about 300 tons of water pipe. Prices are being asked by Carlo Petrillo, Mount Vernon, N. Y., on about 150 tons of 3, 4, 6, 8, 12, 16, 20 and 42-in. pipe and about 25 tons of fittings for a section of subway in Brooklyn, for which he has received the contract. Some inquiry for gas pipe to be delivered next spring is reported from private corporations.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, \$39.60 to \$40.60; 4-in. and 5-in., \$44.60 to \$45.60; 3-in., \$54.60 to \$55.60; Class A and gas pipe, \$4 to \$5 extra.

Warehouse Business.—Most jobbers report the volume of orders, which was sizable earlier in the month, to be diminishing with the approach of the holidays. There is still

some structural steel business, but tonnages are smaller than in the season of greatest activity. Sheet prices are being maintained with little shading, despite a quiet market.

Coke.—Business is limited to shipments on contracts, orders for spot shipment being smaller than usual. The Connellsville market is unchanged at \$3.50 to \$3.75 per net ton, ovens, for standard foundry and \$2.85 to \$3.05, ovens, for standard furnace. Special brands are unchanged at \$4.85 per net ton, ovens. Delivered prices of these brands are \$8.56, delivered to northern New Jersey, Jersey City and Newark, and \$9.44 to New York and Brooklyn. By-product foundry coke prices are unchanged at \$9 to \$9.40, Newark or Jersey City, and \$10.06, New York or Brooklyn.

Old Material.—Prices of most grades of scrap show a slightly stronger tone, although the number of transactions with eastern Pennsylvania consumers has not increased appreciably. Brokers are offering \$14.50 to \$15 per ton, delivered, on No. 1 heavy melting steel and in some cases are reported to have paid as much as \$15.50 per ton, delivered to a Coatesville, Pa., mill. Some of the firmness that has developed in the past week is attributed to the purchase of 5000 tons each by con-

sumers at Coatesville, Pa., and Claymont, Del. At the recent opening of bids on the Pennsylvania Railroad list of about 60,000 tons of scrap, of which about 14,000 tons was heavy melting steel, \$18.10 per ton, is reported to have been offered for the steel. Bids were opened this week on about 3000 tons of scrap on the list of the Delaware, Lackawanna & Western and a like tonnage offered by the Lehigh Valley Railroad.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	\$11.50 to \$12.00
Heavy melting steel (yard)	8.50 to 9.50
No. 1 hvy. breakable cast	11.25 to 11.75
Stove plate (steel works)	8.00 to 8.50
Locomotive grate bars	8.50
Machine shop turnings	7.25 to 7.50
Short shoveling turnings	7.25 to 7.50
Cast borings (blast furn. or steel works)	6.75 to 7.00
Mixed borings and turnings	6.75 to 7.00
Steel car axles	17.00 to 17.50
Iron car axles	25.25 to 26.25
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.00 to 8.50
No. 1 railroad wrought	12.25 to 12.75
No. 1 yard wrot., long	11.25 to 11.75
Rails for rolling	13.00 to 13.50
Cast iron carwheels	12.00 to 12.50
Stove plate (foundry)	9.25 to 9.50
Malleable cast (railroad)	10.00 to 10.50
Cast borings (chemical)	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	\$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

New Method of Quoting on Steel and Iron Boiler Tubes

A new mode of quotation is to be put into effect by makers of lap-welded steel and charcoal iron boiler tubes, effective as of Jan. 1. Weights and list prices used by manufacturers of seamless boiler tubes are to be used from that date. It will be observed in the new schedule that the carload lot base discounts on lap-welded steel tubes are the same as those now quoted on hot-rolled seamless tubes, but against a supplementary discount of 5 per cent on seamless tubes in lots of a carload or more, that on lapwelded steel tubes is two fifths. Also, that against less carload discounts of four points less than on carloads on seamless tubes, the basing discounts on lapwelded steel tubes are four points less than carload lots

on lots down to 10,000 lb. and six points less on lots of less than 10,000 lb.

Discounts as follows, on full carload lots, are being quoted from the revised list prices f.o.b. Pittsburgh:

Steel		Charcoal Iron	
2 in. and 2½ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3½ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3½ in. to 3¾ in.	18
		4 in.	20
		4½ in.	21

Beyond the above base discounts two fifths are being quoted on carload lots of lap-welded steel tubes.

On quantities 10,000 lb. to carloads basing discount is lowered four points and two fifths preferential are allowed.

On quantities less than 10,000 lb., basing discount is lowered by six points and one fifth preferential is allowed.

On charcoal iron boiler tubes the base discount is subject to 10 per cent preferential discount on full carload shipments. On shipments of 10,000 lb. to carload, five per cent preferential and on shipments of less than 10,000 lb., no preferential discount is allowed.

The price list to which the new discounts will apply follows:

External Diameter Inches	Standard Thickness Minimum		Price per Foot			
	Birmingham		Standard Thickness	One Extra Wire Gage	Two Extra Wire Gages	Three Extra Wire Gages
	Wire Gage	Inches		Wire Gage	Wire Gages	Wire Gages
1.....	13	0.095	0.32	0.35	0.38	0.41
1¼.....	13	0.095	0.30	0.33	0.36	0.39

St. Louis

Pig Iron Market Quiet Except for 15,000-Ton Sale of Basic—Steel Orders Fairly Good

ST. LOUIS, Dec. 11.—What otherwise would have been a very quiet week in pig iron was marked by the purchase of 15,000 tons of basic iron by an East Side melter from the St. Louis Gas & Coke Corporation for first quarter delivery. This maker's sales of foundry iron amounted only to 650 tons; the largest order was 200 tons for immediate shipment to a Belleville stove foundry and the remainder was first quarter delivery. The bulk of the foundry iron for first quarter consumption probably has been bought. Stove and jobbing foundries in the district are extremely busy, preparatory to closing down about Dec. 15 until after the holidays. The Granite City maker shipped 37,000 tons and sold 66,520 tons of pig iron during November, breaking all records for a month's shipment and sales. It is expected that the second furnace, which has been down for relining and other repairs for several months, will be blown in some time this week. The market is firm, with prices unchanged.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.	\$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	20.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 81c. (average) Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Domestic coke is in heavy demand as a result of the cold weather, and piles at by-product ovens in the district are being materially reduced. Dealers outside of St. Louis are taking liberal shipments, but those in the city continue to depend upon local piles for their stocks and are buying as they sell. Demand for industrial grades is good. Prices are unchanged.

Finished Iron and Steel.—The Granite City Steel Co. reports orders during the last week were greater than the volume for the same week

last year. Galvanized sheets were most in demand among a greatly diversified business. Buying is almost entirely for prompt shipment. Automobile manufacturers have indicated that strip steel requirements for first quarter will be much heavier than usual for this period, and business is expected to be placed within the next week. The low bidder on the River des Peres sewer project, requiring 2000 tons of reinforcing bars, previously reported as pending, is the W. E. Callahan Construction Co., Arcade Building. The large fabricators of structural steel report a dearth of business, while the smaller plants are in much better shape because of the number of small jobs being placed.

Old Material.—Dealers in old material expect a heavy buying movement soon; some believe it will arrive before the first of the year, while others predict it for the first week in January. There is no consumer buying now except of such items as may be needed for fill-in purposes. Dealers are buying only to cover contracts. The only change in prices is an ad-

vance of 25c. on railroad springs. Railroad lists include: Pennsylvania Lines, 57,440 tons; Chicago, Milwaukee, St. Paul & Pacific, 2600 tons; Wabash, 2642 tons; Southern Pacific, 3000 tons; Missouri-Kansas-Texas, 1500 tons; Louisville & Nashville, 691 tons; Kansas City Southern, 431 tons; Chicago, Rock Island & Pacific, 207 tons; Ann Arbor, 375 tons; Great Northern, 167 carloads; Chicago & Eastern Illinois, 17 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	\$13.25 to \$13.75
No. 2 heavy melting or shoveling steel	12.25 to 12.75
No. 1 locomotive tires	14.50 to 15.00
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	15.00 to 15.50
Railroad springs	16.25 to 16.75
Bundled sheets	9.50 to 10.00
No. 2 railroad wrought	13.25 to 13.75
No. 1 busheling	9.50 to 10.00
Cast iron borings	8.75 to 9.25
Iron rails	13.50 to 14.00
Rails for rolling	15.50 to 16.00
Machine shop turnings	9.00 to 9.50
Steel car axles	19.50 to 20.00
Iron car axles	27.00 to 27.50
Wrot. iron bars and trans.	22.00 to 22.50
No. 1 railroad wrought	12.50 to 13.00
Steel rails, less than 3 ft.	17.50 to 18.00
Steel angle bars	14.25 to 14.75
Cast iron carwheels	14.50 to 15.00
No. 1 machine cast	15.50 to 16.00
Railroad malleable	15.00 to 15.50
No. 1 railroad cast	14.00 to 14.50
Stove plate	12.50 to 13.00
Agricult. malleable	11.50 to 12.00
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Birmingham

Heavy Pig Iron Bookings for First Quarter—Steel Operations at a High Rate

BIRMINGHAM, Dec. 11.—The tone of the pig iron market is still buoyant. Purchases during the week were fairly heavy; the major portion was for delivery through the first quarter. Bookings for the next quarter are larger than for any previous quarter for some time. Only a few of the more important consumers remain uncovered. Radiator shops plan to resume operations shortly after the first of the year. One pig iron producer is still quoting \$17 on No. 2 foundry, while others are maintaining a \$16.50 base. All furnaces have been making heavy shipments, and very little iron has been stocked in the past several weeks. Of the 19 furnaces in blast, nine are on foundry, eight on basic, one on ferromanganese and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	\$16.50 to \$17.00
No. 1 fdy., 2.25 to 2.75 sil.	17.00 to 17.50
Basic	16.50

Finished Steel.—Mills have adjusted prices on bars, plates and shapes, placing them in line with quotations elsewhere. Day to day business continues on a high plane, and the usual seasonal let-up has not developed. Specifications are coming in at a good rate for this season. Rail orders warrant steady operations for several months. Fabricated structural

steel schedules in the district are in good condition. The Nashville Bridge Co. has booked 800 tons for bridges for the Louisville & Nashville Railroad. The Tennessee company is operating nine open-hearths at Ensley, an increase of one in the week, seven are active at Fairfield and the Gulf States Steel Co. is working four at Alabama City.

Cast Iron Pipe.—Dallas, Tex., has awarded a project requiring more than 20,000 tons of pipe to the United States Cast Iron Pipe & Foundry Co. Decision has been pending for several weeks as to steel or cast iron pipe. Injunctions filed since the award have held the contract up but it is expected the matter will be cleared up shortly. This is the largest order placed in this district in several months. Other new business has been confined to a light aggregate of small orders. Inquiries are increasing as municipalities begin to estimate their requirements for the coming year. Some public utilities have asked preliminary figures for use in estimating budgets. Plant operations and forward bookings are the lightest in some time. Quotations are unchanged from the base of \$37 to \$38 on 6-in. and larger sizes.

Coke.—Consumers are maintaining an active interest in first quarter re-

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	3.25c.

Hot-press. nuts, hex., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

quirements and the total needed for this period is fairly well covered. Improved conditions in the pig iron market have influenced more extensive coverage in the coke market than is usual at this season. Domestic sizes are in better demand. The base price of \$5 is being maintained.

Old Material.—Consumers are buying for immediate requirements and keeping stocks low for approaching inventories. Shipments are consequently light. Dealers' stocks are

low in several lines. Prices have not changed in two weeks.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50

Pacific Coast

Standard Oil Co. Inquires for 58,000 Boxes of Tin Plate—Steel for Building Fairly Active

SAN FRANCISCO, Dec. 8 (*By Air Mail*).—Structural steel and reinforcing steel bars were the most active products during the past week. The largest award was 412 tons of bars for the East Bay Municipal Utility District at Oakland, placed with two San Francisco interests. Tin plate mill representatives are keenly interested in the inquiry of the Standard Oil Co., San Francisco, for 45,000 boxes of 14½ x 18½ in. and 13,000 boxes of 10 x 20 in.

Pig Iron.—Sales and inquiries involve relatively unimportant tonnages. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	24.00 to 25.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—A fair tonnage of reinforcing steel bars was placed this week. Included among awards were 300 tons for a power house at Renton, Wash., and 248 tons for the South Spillway, Oakland, placed with the Pacific Coast Steel Co. and 173 tons for the Jackson Creek Spillway and the Pardee Reservoir, Oakland, booked by Soule Steel Co. Pending business exceeds 5500 tons. New inquiries of the week include 355 tons for a rest home in San Francisco and 310 tons for a hotel at Fairfax, Cal. While merchant bar material continues fairly firm at 2.30c., c.i.f. Coast ports, out-of-stock prices in the Los Angeles and San Francisco districts remain at 1.80c., base. Imports of foreign reinforcing steel bars have fallen off almost to nothing.

Plates.—Plate sales and inquiries

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes.....	3.15c.
Soft steel bars	3.15c.
Small angles, ¾-in. and over.....	3.15c.
Small angles, under ¾-in.....	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker....	5.00c.
Black sheets (No. 24).....	5.00c.
Blue ann'd sheets (No. 10).....	4.00c.
Galv. sheets (No. 24).....	5.40c.
Struc. rivets, ½-in. and larger....	5.65c.
Com. wire nails, base per keg....	\$3.40
Cement c'd nails, 100 lb. keg....	3.40

are limited, with one exception, to lots of less than 100 tons. The Marin Municipal Water District, San Rafael, Cal., is calling for bids, to be opened Dec. 18, on a 2,000,000-gal. steel tank requiring 250 tons of plates. From present indications, the total plate tonnage for this year will be approximately 20,000 tons under the total booked last year. No change in prices has occurred, 2.25c., c.i.f., being general.

Shapes.—Although more than 5000 tons of structural shapes is being figured on, awards this week were limited to four projects in excess of 100 tons. The Baker Iron Works took 190 tons for an office building in Santa Monica, Cal., and the Isaacson Iron Works will fabricate 200 tons for a plant addition for itself in Seattle. The Judson-Pacific Co. took 150 tons

for the Grace Cathedral in San Francisco and the Golden Gate Iron Works secured 100 tons for a market building at San Jose, Cal. Quotations on plain material continue unchanged and firm at 2.35c., c.i.f.

Cast Iron Pipe.—Demand for cast iron pipe is by no means heavy and little new business is expected until after the first of the year. L. Coluccio, Seattle, secured an additional 400 tons of 24-in. pipe for the Volunteer Park improvement project for the city. Henry Sacco was low bidder on 209 tons of 8 and 12-in. Classes B and C pipe for the improvement of West Holden Street, Seattle. Bids were opened this week by Burbank, Cal., for 323 tons of 4 to 8-in. Class B pipe. Wilbur N. Edgley, Los Angeles, was low bidder on 548 tons of 2 to 12-in. Class B pipe for the improvement of Arlington Street, Los Angeles.

Steel Pipe.—Pipe mill representatives report a continuation of the rather heavy demand for oil country goods, and especially for well casing to take care of the new wells being brought in in the Santa Fe Hills fields. Stocks of standard pipe in distributors' hands are reported to be in good shape. With the approach of the inventory period, little business is expected during the remainder of the year.

Coke.—About 5000 tons of English beehive and by-product foundry coke has arrived on the Coast, most of it for foundries in the Los Angeles and San Francisco districts. Prices continue unchanged as follows: \$11.50 to \$13 a net ton, delivered incoming dock, on by-product coke and \$16 a net ton on beehive coke.

Canada

Pig Iron Prices Weak and Show Variations—Building Activities Large Despite Winter Weather

TORONTO, ONT., Dec. 11.—According to local blast furnace representatives, the demand for merchant pig iron in the Canadian markets has steadily increased during the past month or six weeks, while sales for the year show an advance of more than 20 per cent over those of 1927. Producers have opened books for first quarter contracts and already a fairly large number of melters have covered for the first three months of 1929. Inquiries for first quarter are appearing in large number, and indications are that contracts for that period will make a new quarterly record. While local interests believe that higher prices are warranted in the face of \$18 to \$19 Buffalo quotations, producers have been unable to agree, and while some have quoted \$24.10, others are naming \$23.60, and in some instances iron has been offered at \$23.10, Toronto. One Canadian producer is out of the market, declining to sell at the present level. United States producers are supplying the Canadian agricultural implement re-

quirements, but otherwise they are not strong in competition with Canadian furnaces at present. Imports of pig iron range from 4000 to 5000 tons a month, by far the greater part of which is from the United States. Only a limited tonnage of British iron has been piled in Canada against winter requirements.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75.....	\$23.60
No. 2 fdy., sil. 1.75 to 2.25.....	23.60

No. 2 fdy., sil. 1.75 to 2.25.....	25.00
Malleable	25.00
Basic	24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—Although the first snows of winter have appeared, building construction in Canada has not slowed down. The demand for structural steel and reinforcing bars for building and bridge construction continues in large volume. The Manitoba Bridge Co., Winnipeg, Man., has received an order for 3000 tons

of steel from the Canadian National Railways for a bridge over Minnewaskta Creek near Minnietta, Man.; the Eastern Canada Steel & Iron Works, Ltd., Quebec, Que., was awarded contract for 300 tons of steel for Scott Street bridge over the St. Charles River at Quebec for the Provincial Government Department of Public Works; the Dominion Bridge Co., Lachine, Que., received contract for 600 tons for Masonic Temple on Sherbrooke Street, Montreal; the Dominion Bridge Co., Toronto, has contract to supply 1250 tons of steel for office building at Bay and Adelaide Streets, Toronto, for the Canada Permanent Mortgage Corporation, and 50 tons for New Queen's Hotel at Belleville, Ont. Orders pending include 300 tons for bridge on St. Clair Avenue, to be constructed by the City of Toronto and York Township; 350 tons for normal school at Quebec, Que., for Rev. Ursuline Sisters.

Old Material.—In most cases, consumers are holding their orders as

low as possible to keep prices at a minimum and are leaving dealers somewhat in doubt as to what future requirements will be. Some consumers, however, have covered first quarter needs. While Toronto dealers have made no change in their buying price lists for the week, a few minor advances have gone into effect in Montreal.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	\$9.50	\$7.00 to \$7.50
Rails, scrap	10.00	9.00
No. 1 wrought	9.00	11.00 to 11.50
Machine shop turnings	7.00	5.00
Boiler plate	7.00	6.00
Heavy axle turnings	7.50	6.50
Cast borings	7.50	5.00
Steel turnings	7.00	5.50
Wrought pipe	5.00	5.00
Steel axles	14.00	20.00
Axles, wrought iron	16.00	22.00
No. 1 machinery cast	16.00 to	17.00
Stove plate	13.00	13.00
Standard carwheels	13.00	16.00
Malleable	13.00	13.00
Per Net Ton		
No. 1 machinery cast	15.00	
Stove plate	9.00	
Standard carwheels	13.00	
Malleable scrap	13.00	

Boston

Everett Furnace Sells 12,000 Tons of Pig Iron to Heater Manufacturer—Scrap Exports Continue

BOSTON, Dec. 11.—The Mystic Iron Works has sold 12,000 tons of pig iron for first quarter delivery to a radiator and heater manufacturer, part No. 2 plain and part No. 2X, for delivery by barge and rail. Details regarding prices are withheld, but it is understood that quotations coincided with those of Buffalo furnaces. Sales of Mystic iron the past week otherwise were comparatively small. Numerous small tonnages were placed, however, at \$21 a ton, on cars Everett, Mass., for No. 2X, or \$23.27 delivered, and others at \$20 a ton, furnace, or \$23.65 a ton delivered. The company is well sold up to April 1. It has contracted to deliver between now and April 1 in excess of 36,000 tons for water shipment alone, 11,500 tons of which is for January shipment. In addition to the Mystic bookings the past week, a fair tonnage of Buffalo and east of Buffalo iron was sold, also some foreign iron. About 1000 tons of Lake charcoal iron has been booked the past three or four weeks for first quarter delivery at \$24 a ton, base furnace.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25...	\$22.91
*Buffalo, sil. 2.25 to 2.75...	23.41
East. Penn., sil. 1.75 to 2.25...	\$24.15 to 24.65
East. Penn., sil. 2.25 to 2.75...	24.65 to 25.15
Va., sil. 1.75 to 2.25...	26.91
Va., sil. 2.25 to 2.75...	27.41
Ala., sil. 1.75 to 2.25...	23.41 to 25.77
Ala., sil. 2.25 to 2.75...	23.91 to 26.27

Freight rates: \$4.91 all rail from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate.

Coke.—Aside from a quickening in the movement of domestic coke, the result of colder weather, there is little change in the coke situation. By-

product foundry coke is still available at \$11 a ton, delivered within a \$3.10 freight rate zone.

Bars.—Edward A. Tucker Co., Boston, has been awarded 650 tons of reinforcing bars for the United Shoe Machinery Corporation's Boston building, the largest job let in this territory in several months. The market on small business is usually 3.10½c. per lb., base, from stock, and at 3.01½c. on 25 to 75-ton lots. A slight improvement in the demand for soft steel bars is noted, with the market 1.90c. to 2c. per lb., base Pittsburgh, depending on quantity.

Warehouse Business.—Wire nails have been advanced \$2 a ton. The movement of material out of warehouses is increasing, and is far ahead of that done in December, 1927.

Pipe.—Pawtucket, R. I., closed bids Dec. 4 on about 1200 tons of 6 to 16-in. pipe. The contract was awarded to a local concern, and it is reported the Warren Foundry & Pipe Co. will supply the material. Herbert Kennedy Co., New York, representing French pipe interests, submitted a bid approximately \$4 a ton under that of the Warren Foundry & Pipe Co., but the city officials announced they would use American-made pipe. Portland, Me., has closed privately on 650 to 700 tons of 6 to 16-in. pipe for spring delivery. It is understood the business was divided between two American makers. Kingston, Mass., has closed bids on 200 tons of pipe, but has made no award. Salem, Mass., will take bids on Dec. 11 for 100 tons of 12-in. pipe. Private business for prompt delivery is exceptionally good for this time of the year and totaled about

1000 tons the past week. Prices are stronger, 4-in. stock now being \$47.10 to \$48.10 a ton, delivered common Boston freight rate points, and 6-in. and larger, \$44.10 to \$45.10, with differentials of \$3 to \$4 a ton on Class A and gas pipe.

Old Material.—The market for the materials most in demand, namely, heavy melting steel and mixed borings and turnings, is firmer. Steel mill borings, forge flashings and shafting are easier. Dealers expect a further improvement in values of heavy melting steel based on the recent sale of Baltimore & Ohio Railroad and Pennsylvania Railroad scrap to consumers. New England scrap owners are reluctant to sell at present prices; consequently the movement out of New England is limited, although somewhat larger than a week ago. A steamer has completed loading 3500 tons of scrap for Danzig. One agent has a 3000-ton cargo to load, and it is intimated still another lot of 3000 to 5000 tons will be shipped within a month. It is probable that 1929 scrap exports from Boston will exceed those of 1928; most of the material has been consigned to Danzig.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	\$11.00 to \$11.25
Scrap T rails	10.50 to 11.00
Scrap girder rails	10.00 to 10.25
No. 1 railroad wrought	11.00 to 11.50
No. 1 yard wrought	9.00 to 9.50
Machine shop turnings	6.25 to 6.50
Cast iron borings (steel works and rolling mill)	5.75 to 6.00
Bundled skeleton, long	9.00 to 9.25
Forge flashings	9.00 to 9.50
Blast furnace borings and turnings	5.50 to 6.00
Forge scrap	6.00 to 6.50
Shafting	13.50 to 13.75
Steel car axles	16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.50 to 10.00
Rails for rolling	11.00 to 11.50
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	\$14.00 to \$14.50
No. 1 machinery cast	15.00 to 15.50
No. 2 machinery cast	13.00 to 13.50
Stove plate	11.00 to 11.50
Railroad malleable	15.50 to 15.75

Cincinnati

Tennessee Producer Advances Pig Iron 50c.—Sheet Mills in Better Position Than a Month Ago

CINCINNATI, Dec. 11.—A Tennessee furnace has announced an advance of 50c. a ton to \$17, base Birmingham, but Alabama pig iron producers, with one exception, still are quoting \$16.50. However, all Southern sellers are expected to be on the basis of \$17 within a short time. Transactions in the pig iron market in the past week were unimportant, total sales having been less than 3000 tons. Dealers are of the opinion that the present lull in buying will persist until after the annual inventory period. Inquiries are scarce; the only pending order of consequence is for 400 tons of Northern foundry for a Springfield, Ohio, consumer. Small lots of Valley iron are being sold by local brokers at or under \$18, Valley furnace. Southern Ohio foundry iron is nominally quoted at \$18.50, base Ironton.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	\$20.39
Ala. fdy., sil. 1.75 to 2.25	\$20.19 to 20.69
Ala. fdy., sil. 2.25 to 2.75	20.69 to 21.19
Tenn. fdy., sil. 1.75 to 2.25	20.69
S'th'n Ohio silvery, 8 per cent	27.89 to 28.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Coke.—Shipments of by-product foundry coke are of fair volume, although demand from foundries connected with the automotive industry has been light. Sales of domestic grades are stimulated by the fact that an increase of 50c. a ton is to be made on Jan. 1. A local dealer has sold 1000 tons of beehive foundry coke to a nearby consumer. Wise County beehive foundry is quoted at from \$4.25 to \$5.25 and furnace coke at \$3.50.

Old Material.—The scrap market has been fairly firm. While there has been some letdown in specifications from district steel plants, consumption in general is satisfactory. Railroad lists closing this week include: Southern, 9000 tons; Norfolk & West-

ern, 5000 tons; Louisville & Nashville, 6000 tons, and Chesapeake & Ohio, 3000 tons.

Finished Material.—From the standpoint of unfilled tonnage, district sheet mills are in a much better position than a month ago, despite the fact that automobile makers concentrating on new models have failed to come into the market to any appreciable extent for their sheet requirements. The betterment is attributed to the healthy demand from diversified sources, and, as automobile manufacturers will soon be placing business in larger volume, sheet producers are confident of entering the first quarter well fortified with orders. Mill operations have been sustained at 100 per cent of capacity and no departure from this schedule is expected in the next two weeks. Prices are steady and considerable business has been taken at

2c. to 2.10c., base Pittsburgh, for blue annealed; 2.85c. for black; 3.60c. for galvanized, and 4.10c. for automobile body stock. Heavy steel products have been rather quiet, with quotations firm at 1.90c. to 2c., base Pittsburgh, for bars, shapes and plates. Rail steel reinforcing bars are priced at 1.90c. to 1.95c., base mill. Fabricating shops in this district are only fairly busy, and in most cases are in need of considerable work.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.00 to \$13.50
Scrap rails for melting....	13.25 to 13.75
Loose sheet clippings....	9.50 to 10.00
Bundled sheets	10.25 to 10.75
Cast iron borings.....	9.25 to 9.75
Machine shop turnings....	8.75 to 9.25
No. 1 busheling	10.75 to 11.25
No. 2 busheling	6.25 to 6.75
Rails for rolling	14.00 to 14.50

No. 1 machinery cast....	18.50 to 19.00
No. 1 railroad cast.....	15.00 to 15.50
Burnt cast	10.00 to 10.50
Stove plate	10.00 to 10.50
Brake shoes	10.25 to 10.75
Railroad malleable	14.25 to 14.75
Agricultural malleable	13.25 to 13.75

Youngstown

Demand Tapering in Most Steel Products

YOUNGSTOWN, Dec. 11.—Not much variation is observed in the rate of demand for pipe. Strip business has been swelled by the placing with local producers of one or two good-sized first quarter contracts, but in most other finished steel products business has lately been declining sheet mill operating schedules have become a little irregular, since many users of sheets are anxious to escape carrying sizable stocks at the end of the month and are specifying cautiously. November specifications were so large with most makers that backlogs were pretty well reduced; as an advance of \$2 a ton is sought on first quarter tonnages, buyers are disposed to go slowly in the matter of commitments for that period until they are entirely satisfied that the higher prices will hold. Yesterday was the final day for specifying on fourth quarter sheet contracts and this week will tell whether buyers released tonnages or elected to take their chances on paying \$2 a ton advance, which the mills threatened to do if January shipment was specified.

Tin plate capacity is becoming more fully engaged as tonnages are released on early 1929 requirements. Wire products are only moderately active, but there is the possibility of an early increase in demand in view of the fact that first quarter prices have been advanced \$2 a ton over those for the quarter now drawing to a close. In naming the new schedule, mills have adopted a new mode of quotation; instead of quoting jobbers'

carloads they are quoting as the "market" the prices named to retailers or consumers able to buy in carload lots. For several months, the mills have been trying to apply an extra of 10c. per 100 lb. on carload lots going to other than jobbers. The price of nails to the latter has been \$2.55, base, per keg, Pittsburgh, which would have meant \$2.65, base, on retailers' or consumers' carloads. The new schedule calls for \$2.75, base, and is for retailers' or consumers' carloads. Announcements contain no word as to jobbers' carloads, but it is assumed they will continue to go at 10c. less.

First quarter contracting as a whole has not yet developed much activity or volume. With bars at the same prices for that period as for this quarter, buyers do not seem to see any need for haste. With current buying and specifying on a moderate scale, mill rollings are a little hard to schedule. Ingot production holds pretty close to 80 per cent of capacity, but some recession is likely unless there is an early quickening in the demand for finished products.

Sharon Steel Hoop Co. is maintaining a good operation at its several plants in the district, notably at Sharon, where improvements have permitted not only increased output of hot and cold-rolled strips, but much more efficient operation. The cold strip mills, recently installed, comprising eight stands of cluster mills and 16 stands of two-high mills, now are in full and regular production. The company will begin installation soon of a new continuous hot strip mill and expects to have it in operation by next March. It will be used in rolling widths 12 in. and under. Some consideration was given to a mill for roll-

ing wide strips, but it was finally decided that there already was sufficient wide strip capacity in the country.

The furnace of the Struthers Furnace Co., Struthers, Ohio, is being dried out after its recent relining and

it will probably be blown in next Saturday; it will start with a backlog of basic, foundry and malleable grades of more than 25,000 tons, much of the two latter grades being for shipment to western Ohio and Indiana points.

Mill Co. of New York and then to its successor, the American Universal Mill Co., Scranton, Pa., which is a party to the suit.

The United States Steel Corporation in 1926 began reconstruction of its Carnegie mills at Homestead, Pa., for the rolling of H-sections, and in December of that year the first beam was produced.

Buffalo

Pig Iron Inquiry Light—Steel Mills Maintain 90 Per Cent Rate—Scrap Market Fairly Steady

BUFFALO, Dec. 11.—Inquiry in the pig iron market during the past week has been light. About 6000 tons has been sold, mostly in 100-ton and smaller lots. Producers believe there is still quite a tonnage to be placed for the first quarter. Prices are firm in the district, although there are some instances of 2X iron from Buffalo going to points eastward for the same price as No. 2 plain. Malleable foundries are considerably busier owing to a revision of policy on the part of some of the automobile makers. One large automobile company is beginning to use more malleable castings. A block of 10,000 tons of iron, which had been held by speculators, and which had been purchased by a producer, has been shipped to the buyer. The Tonawanda Iron Corporation is expected to place its stack in blast toward the end of December.

Prices per gross ton, f.o.b. furnace:
No. 2 fdy., sil. 1.75 to 2.25 \$18.00 to \$18.50
No. 2X fdy., sil. 2.25 to 2.75 18.50 to 19.00
No. 1X fdy., sil. 2.75 to 3.25 19.50 to 20.00
Malleable sil. up to 2.25 18.50 to 19.00
Basic 17.50 to 18.00
Lake Superior charcoal 27.28

Finished Iron and Steel.—Operations at Buffalo mills are being maintained at about 90 per cent of capacity. First quarter inquiry and specifications are coming in. The bar, shape and plate price is 2.10c., base Buffalo, but in some instances 2.05c. has been done. Sheets are firm at 2.85c. for black, 3.60c. for galvanized, 2.10c. for blue annealed and 4.10c. for automobile body. New hot-rolled strip prices are 2c., base, for 6 in. and under, and 1.90c. base, for wider than 6 in., but some of the larger buyers have been able to obtain as low as 1.90c. and 1.80c., respectively. Structural jobs show an increasing tonnage.

Old Material.—A comparatively small lot of strictly No. 1 heavy melting steel has been sold at \$16.50. Dealers expect another mill to come into the market soon for a substantial tonnage. A consumer of No. 1 machinery cast and stove plate, who is about to buy, does not expect to pay over

\$15 for the cast and \$14.50 for the stove plate. Some small sales of No. 1 machinery cast were made during the week at \$16, and several small lots of malleable were sold at \$16. Dealers report a scarcity of malleable. Sales of knuckles and couplers are reported at \$17.50. Machine shop turnings and borings and turnings from the central part of the State are going into Pittsburgh and Youngstown districts. The market appears to be steady; dealers have plenty of orders to fill.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades
No. 1 heavy melting steel \$15.50 to \$16.50
No. 2 heavy melting steel 13.25 to 14.00
Scrap rails 15.50 to 16.00
Hydral. comp. sheets 13.50 to 14.00
Hand bundled sheets 12.00 to 12.50
Drop forge flashings 13.00 to 13.75
No. 1 busheling 14.50 to 15.50
Hvy. steel axle turnings 13.50 to 14.00
Machine shop turnings 7.50 to 8.00

Bethlehem Sues Corporation on Grey Beam Patents

The Bethlehem Steel Corporation has brought suit in the Federal District Court at Newark, N. J., against the United States Steel Corporation and its subsidiaries, the Carnegie Steel Co. and the American Bridge Co., for \$250,000,000 damages for alleged patent infringement and asks for a permanent injunction to restrain the corporation from manufacturing and selling the special structural beams known as Grey beams, to which the Bethlehem Steel Corporation claims exclusive rights.

The Grey patents were originally assigned to the American Universal

Hay Foundry & Iron Works Completes Record Job

The Hay Foundry & Iron Works, Newark, N. J., structural steel fabricator, has recently completed a building job in what is believed to be a record time. On Sept. 17, work was begun on the fabrication of 2200 tons of steel for an apartment building at Madison Avenue and Seventieth Street, New York, and erection was completed on Oct. 18. The building is 11 stories high, with 30,000 sq. ft. of floor space, and is being built for the Tishman Realty & Construction Co. The steel work represented the assembly of 9762 pieces of steel and the driving of 36,200 rivets in the field. Owing to the rapidity with which the steel was fabricated and erected, it is expected that the building will be ready for occupancy by May 1, 1929.

McMyler-Interstate Plant to Be Sold at Auction

The plant of the McMyler-Interstate Co., Bedford, Ohio, has been ordered sold under foreclosure proceedings. P. A. Connolly, receiver of the company since April 23, 1928, has been appointed special master to sell the property at public auction. The foreclosure proceedings resulted from an agreement of attorneys for the company and the Union Trust Co., Cleveland, holder of \$1,312,793 in McMyler-Interstate bonds secured by mortgage on the property and on which the company had failed to meet the last two interest payments. The chief reason for the receivership was that while assets were far in excess of liabilities the company was in debt in excess of \$2,000,000, and lacked money to continue its business. The McMyler-Interstate Co. was engaged in the manufacture of an extensive line of heavy equipment, including locomotive cranes, steam shovels and pile drivers. It also manufactured forgings.

The organization of Lee Wallis Gibbons, 70 East Forty-fifth Street, New York, has been appointed Eastern representative for the Globe Steel Tubes Co., Milwaukee, maker of stainless chromium steel tubes. All other territories are handled by the company's own district sales offices.

Quotations for equipment for chiling of cast iron bars are requested by Fabrique Nationale d'Armes de Guerre, Herstal, Belgium.

Non-Ferrous Metal Markets

Copper Quiet But Firm, Tin Active and Lower, Lead and Zinc Sales Light with Quotations Unchanged

NEW YORK, Dec. 11.

Copper.—Buying by both domestic and foreign consumers has shrunk decidedly, but prices continue very firm. In the past week domestic consumers have been purchasing small quantities for fill-in requirements and also some metal for February delivery. Moderate buying of March metal has also appeared. It is estimated that consumers must still buy considerable metal for February. Foreign consumers have by no means bought the metal they will need for December and for January and February. Electrolytic copper is quoted at 16c., delivered in the Connecticut Valley,

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY		Dec. 11	Dec. 10	Dec. 8	Dec. 7	Dec. 6	Dec. 5
Lake copper, New York.....	16.12½	16.12½	16.12½	16.12½	16.12½	16.12½	16.12½
Electrolytic copper, N. Y.*.....	15.75	15.75	15.75	15.75	15.75	15.75	15.75
Straits tin, spot, N. Y.....	49.50	50.12½		49.95	51.00	51.50	51.50
Lead, New York.....	6.50	6.50	6.50	6.50	6.50	6.50	6.50
Lead, St. Louis.....	6.35	6.35	6.35	6.35	6.35	6.35	6.35
Zinc, New York.....	6.70	6.70	6.70	6.70	6.70	6.70	6.70
Zinc, St. Louis.....	6.35	6.35	6.35	6.35	6.35	6.35	6.35

*Refinery quotation; delivered price ¼c. higher.

and at 16.25c., c.i.f. European ports. Specifications on contract for domestic consumption continue heavy, but thus far there is no prospect of a scarcity, as production is gradually increasing. Lake copper is quiet but firm at 16c. to 16.12½c., delivered.

Tin.—Consumers of Straits tin have been quite active and dealers have also entered the market, so that the total sales of this grade for the week ended Saturday, Dec. 8, were about 1500 tons. Chief interest was in December-January arrivals. The London market has been fluctuating within rather wide limits. On Dec. 7, the market was down over £4 per ton, and yesterday it declined still further, or about £2, with an extreme fluctuation in the East of £9 10s. Today, however, London advanced £1 10s. and the Eastern price recovered £7 15s., so that quotations stood at £227 10s. for spot standard, £225 for future stand-

ard and £227 12s. 6d. for spot Straits, all about £12 below the quotations of a week ago. The Singapore market today was £230 5s., also about £12 less than a week ago. The market on this side this week has been moderately active, with spot tin quoted today at 49.50c., New York. Today's market closed weak. The first week on the new National Metal Exchange was active and sales were satisfactory.

Lead.—Demand is not so large as it has been recently, but several good-sized contracts for January-February have been put through in the last day or two. On the whole, the market is quiet with inquiry at St. Louis a little more active than in the East. Prices continue firm and unchanged at 6.35c., St. Louis, with a number of producers practically sold up for December and January. The contract price of the leading interest continues unchanged at 6.50c., New York.

Metals from New York Warehouse

Delivered Prices Per Lb.

Tin, Straits pig.....	52.00c. to 53.00c.
Tin, bar	54.00c. to 55.00c.

Brazed Brass Tubes.....	
28.50c.	

Zinc.—Quotations for prime Western zinc are firm at 6.35c., East St. Louis, or 6.70c., New York, for delivery through the first quarter. Buying has slackened decidedly, as might be expected after the heavy purchasing by consumers recently. They still, however, have considerable to buy for the first quarter. Contrary to expectations, the ore price at Joplin was unchanged last week at \$40 per ton, although purchases were large at over 14,300 tons, though less than those of the week before. Shipments were slightly in excess of 19,000 tons, but because the output for the week increased only about 200 tons to 12,400 tons, there was a marked reduction in stocks, which are now estimated at about 44,100 tons. Early in November these stocks were about 57,800 tons.

Antimony.—Demand for Chinese metal is less active and quotations are lower at 9.62½c., duty paid, New York, for all positions.

Nickel.—Ingot nickel in wholesale lots for this and next year's delivery is quoted unchanged at 35c., with shot nickel at 36c. Electrolytic nickel is held at 37c. per lb. for this year's delivery, but for 1929 the quotation will be on the same basis as asked for ingot and shot nickel.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Markets at Chicago

CHICAGO, Dec. 11.—Prices of tin, copper and antimony are lower. Sales of non-ferrous metals in this market are little changed from a week ago. The old metal market is steady.

Prices, per lb., in carload lots: Lake copper, 16.25c.; tin, 51c.; lead, 6.45c.; zinc, 6.45c.; in less-than-carload lots: antimony, 10.75c. On old metals we quote copper wire, crucible shapes and copper clips, 12.50c.; copper bottoms, 11.25c.; red brass, 10.75c.; yellow brass, 8.25c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 27c.; tin foil, 27c.; block tin, 39c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Newton Steel to Increase Sheet Capacity

From proceeds of new financing, the Newton Steel Co., Newton Falls, Ohio, will enlarge its capacity for rolling steel sheets by adding 10 hot mills and auxiliary equipment to the 20 mills which comprise the present plant. At a special meeting Dec. 10, stockholders ratified financing plans, whereby the company expects to raise \$1,750,000 for the improvements. The plan calls for an increase in the authorized common stock of no par value from 100,000 to 300,000 shares. Of this increase, 100,000 shares will be used to exchange the present common for new, on the basis of one new for one old. In addition, 40,000 shares will be issued and have been sold at \$43.75 per share to a banking syndicate.

Reinforcing Steel

Awards of 4300 Tons—4275 Tons in New Projects

AWARDS of 4300 tons reported during the last week included no jobs of outstanding size. New projects, amounting to 4275 tons, were also of small size, ranging from 100 to 800 tons. Awards follow:

BOSTON, 650 tons, United Shoe Machinery Corporation office building, to Edward A. Tucker Co.

BROOKLYN, 200 tons, Abraham Lincoln High School; from George F. Driscoll Co., general contractor, to Carroll-McCreary Co., Inc.

HACKENSACK, N. J., 500 tons, Pennsylvania Railroad bridge; from Foundation Co., general contractor, to Carroll-McCreary Co., Inc.

LOCKPORT, N. Y., 125 tons, addition to Harrison Radiator Co., to a Buffalo maker.

PITTSBURGH, 400 tons, Arlington apartment building, to Truscon Steel Co.

SOUTH BEND, IND., 120 tons, building for Sears, Roebuck & Co., to Concrete Steel Co.

CHICAGO, 300 tons rail steel bars, Northwest Lyons Club, to Calumet Steel Co.

CHICAGO, 150 tons, Harrington warehouse, to Concrete Engineering Co.

ST. LOUIS, 300 tons, Deaconess Hospital, to Laclede Steel Co.

NORTH LITTLE ROCK, ARK., 300 tons, high school, to Sheffield Steel Corporation.

STARKVILLE, MISS., 230 tons, several buildings for Agricultural and Mechanical College of Mississippi, to Connors Steel Co.

SAN FRANCISCO, 100 tons, Magnin's store, to Gunn, Carle & Co.

SAN FRANCISCO, 100 tons, two apartment buildings, Broadway and Octavia Street, to W. S. Wetenhall Co.

SAN FRANCISCO, 131 tons, Bekins storage warehouse, to Gunn, Carle & Co.

OAKLAND, CAL., 248 tons, South spillway, East Bay municipal utility district, to Pacific Coast Steel Co.

OAKLAND, 173 tons, Jackson Creek spillway and Pardee Reservoir, East Bay municipal utility district, to Soule Steel Co.

RENTON, WASH., 300 tons, power house for Puget Sound Power & Light Co., to Pacific Coast Steel Co.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BOSTON, 170 tons, Massachusetts General Hospital addition.

NEW YORK, 750 tons, sections 1 and 2, route 103, Houston Street subway; bids Dec. 28.

RICHMOND HILL, N. Y., 175 tons, telephone building; White Construction Co., general contractor.

NEWARK, 800 tons, manufacturing building for Hoffman Beverage Co.

KEARNY, N. J., 225 tons, manufacturing building for Western Electric Co., Inc.

HACKENSACK, N. J., 275 tons, Pennsylvania Railroad bridge; Triest Contracting Corporation, general contractor.

CHAMPAIGN, ILL., 100 tons, Mantino State Hospital; English Brothers, low bidders on general contract.

CHICAGO, 300 tons, La Salle Club; K. M. Vitzhum, architect.

CHICAGO, tonnage being estimated, office building at 1 N. La Salle Street; John Griffiths Co., general contractor.

HOUSTON, TEX., 700 tons, building for Sears, Roebuck & Co., B. W. Construction Co., Chicago, general contractor.

BELLINGHAM, WASH., 100 tons, building for Washington Cooperative Egg & Poultry Association; bids being taken.

NEWPORT BEACH, CAL., 113 tons, two bridges; bids Dec. 17.

FAIRFAX, CAL., 310 tons, hotel, bids being taken.

SAN FRANCISCO, 355 tons, Rest Home for Christian Science Church; bids opened.

Forms Non-Ferrous Ingot Committee

A special committee of the American Society for Testing Materials to promote the general use of specifications for copper alloys in ingot form held a meeting in Cleveland late in November and organized. The chairman of the committee is Guillian H. Clamer, president Ajax Metal Co., Philadelphia.

The committee was appointed to undertake the solving of problems arising from the publication in technical and trade journals of prices of ingot metals which, it is stated, make no allowance for grade of material used, varying percentages of impurities or the tolerances permitted in composition. The following plan of action was decided upon by the committee:

1. To enlist the cooperation of the Non-Ferrous Ingot Metal Institute in educating consumers to standard alloys, standard requirements and specifications with as few variations as possible from these standards.

2. To obtain all possible specifications from consumers and producers of ingot copper alloys. These specifications will be compiled and tabulated, and as soon as possible a stand-

ard specification will be submitted to the proper committee of the A. S. T. M. with the recommendation that this be put through the regular procedure for the development of the standards.

C. L. Warwick, secretary-treasurer of the A. S. T. M., was made secretary of the new committee.

Pressed Metal Institute to Meet at Detroit

The December meeting of the Pressed Metal Institute will be held in Room 20-221 General Motors Building, Detroit, on Dec. 19. The morning sessions will consist of group meetings, the light stampings and heavy stampings groups meeting separately, while at the afternoon session both groups will meet as the Pressed Metal Institute. The members of the institute and other stamping manufacturers will be the guests of the Purchasing Agents' Association of Detroit, at dinner at 6.30, following which W. W. Galbreath, president Youngstown Pressed Steel Co., Youngstown, and also president of the Pressed Metal Institute, will speak on "Today's Problems and Today's Purchasing Agent."

PERSONAL

JOHN J. OTT, president and general manager B. Ott & Sons Co., LaCrosse, Wis., machine shop, severed his connections with the concern on Dec. 1 and will retire from active business. Mr. Ott served his apprenticeship as a machinist in what now are the Allis-Chalmers Mfg. Co. and Vilter Mfg. Co., Milwaukee, returning to LaCrosse in 1893 to become superintendent of his father's plant. He became president, upon the death of his father, Benedict Ott, in 1905.

J. MURRAY RIDDELL is now associated with Crowell & Murray, Inc., Perry-Payne Building, Cleveland, consulting mining engineer, chemist, assayer and metallurgist. For the past 10 years he has been employed by the Corrigan, McKinney Steel Co., Cleveland, as reporting engineer, assistant district superintendent of its Menominee Range iron ore mines and general superintendent of its Kentucky coal mines. He is a graduate of the Michigan College of Mines.

HARRY A. PRATT, purchasing agent Wilcox-Crittendon Co., Middletown, Conn., has been made assistant general manager. James O. Lord succeeds him as purchasing agent, and Henry Hanson has been made plant manager.

EARL R. STEWART, formerly president and general sales manager of the North Western Expanded Metal Co., has been made a member of the firm of the Dillaby Fireproofing Co., Boston.

H. B. KNOWLTON, metallurgist International Harvester Co., Fort Wayne, Ind., addressed the Indianapolis chapter of the American Society for Steel Treating on Dec. 10, his subject being "Steel Failures and How to Produce Them."

W. C. MACFARLANE, president of the Minneapolis Steel & Machinery Co., has been elected president of the Manufacturers' Association of Minneapolis. Other officers elected were S. V. Wood, president Minneapolis Electric Steel Castings Co., first vice-president; R. G. Mitchell, vice-president Dodson-Fisher Co., second vice-president; C. B. Mills, president Midland National Bank & Trust Co., treasurer, and Alexis Caswell, secretary and business manager.

ARTHUR J. TUSCANY, manager of the Gray Iron Institute, Cleveland, was recently presented with a marble and gold desk set by the Ohio Foundries Association, Inc., of which he was secretary and manager for nearly seven years prior to his connection with the Gray Iron Institute. The presenta-

tion was made by C. C. SMITH, Toledo Castings Co., Toledo, Ohio, president of the Ohio Foundries Association.

H. M. REED, who has been vice-president and general manager of factories for the Standard Sanitary Mfg. Co., Pittsburgh, has been named first vice-president and chairman of the executive committee, succeeding the late J. W. Oliver. THEODORE E. MULLER succeeds Mr. Reed. R. E. SARGENT, general sales manager, has been elected vice-president and a director. F. F. KAULBACH also is a new director of the company.

SAM TOUR

SAM TOUR, who resigned as metallurgist, Doehler Die Casting Co., several months ago, has established an office as consulting engineer at 123 North Street, Batavia, N. Y. He will devote attention to problems in die casting and heat treating (especially in salt baths). He is a graduate of University of Colorado, and received the degree of Master of Science from the University of Michigan. During the war and until 1921 he was attached to the Army Ordnance Department. Since 1921, as metallurgist for the Doehler company, he has discovered die steels of great serviceability and has pioneered in producing castings of high zinc content, with zinc of unusual purity. He has written and lectured widely on the salt bath method of heat treating and furnaces therefor. Mr. Tour has been chairman of both the Washington and New York chapters of the American Society for Steel Treating; is a member of the executive committee of the Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers, and is secretary of the Committee on Corrosion of Non-ferrous Metals and Alloys of the American Society for Testing Materials.

L. B. GODFREY has been appointed Eastern sales manager for the Cuya-

hoga Steel & Wire Co., Cleveland, and will have offices at 70 North Beacon Street, Hartford, Conn. For the past 10 years he has been associated with the machine tool industry.

F. WARD COBURN has been elected a director of the E. & G. Brooke Iron Co., Birdsboro, Pa.

CALVIN E. BRODHEAD, formerly vice-president Scranton Bolt & Nut Co., Scranton, Pa., has been placed in charge of a sales office which has been opened at 393 Seventh Avenue, New York, by the Wrought Iron Co. of America, recently formed by a merger of the Lebanon Iron Co., Lebanon, Pa., and the Scranton company.

CHARLES A. LAMPARD has been appointed special sales representative in New England for the Poldi Steel Corporation of America, 245 West Eighteenth Street, New York. He was previously in charge of metallurgical work for the Yale & Towne Mfg. Co., Stamford, Conn., and also was for a time in charge of the heat treating departments of the Union Metallic Cartridge Co., Bridgeport, Conn., and furnace and metallurgical specialist for the General Electric Co., Schenectady, N. Y.

WALTER J. DONNELLY, trade commissioner at Montreal for the Department of Commerce, has been promoted to the position of commercial attaché at Bogota, Colombia.

REAR ADMIRAL W. A. MOFFETT, chief of the Navy Bureau of Aeronautics, was the guest of honor at a dinner given by the Detroit Aviation Society, Dec. 5. He predicted a bright future along commercial lines for lighter than air machines and added that, while the dirigible will eventually play an important part in transportation to Europe, its most fertile field now is between North and South America, where ideal weather conditions prevail all year around on the airways between the two continents.

New Direct Steel Process of W. H. Smith

A process for making sponge iron, or steel, direct from the ore "without the use of coal or coke," has been under development in the past few years by William H. Smith, Detroit, but nothing authentic regarding it has been obtainable. Mr. Smith, who was connected at one time with the Ford Motor Co., as head of its research department, has been perfecting his process through work at the University of Detroit, and at a small commercial plant located near Detroit. The company organized to handle the process is the General Reduction Corporation, which, it is emphasized, is not owned by Henry Ford or the General Motors interests. Rights to use the process have been leased to the Ford Motor Co. and negotiations are under way for use of the process in certain foreign countries.

Railroad Equipment

Missouri Pacific Will Buy 3000 Freight and 40 Passenger Cars—Lehigh Valley Inquires for 1000 Cars

NEW inquiries for freight cars which have come out during the week total nearly 5000, the largest being 3000 for the Missouri Pacific, 1000 for the Lehigh Valley and 500 for the Chicago Great Western. The Missouri Pacific will also buy 40 passenger train cars and 25 switching locomotives. The Chicago & North Western has ordered 200 ballast cars, and the Seaboard Air Line, 200 hopper cars. Details of the week's business follow:

Missouri Pacific has issued inquiries for 1000 50-ton box cars, 750 40-ton and 250 50-ton automobile cars, 500 70-ton hopper cars, 500 40-ton stock cars, 60 caboose cars and 20 air-dump cars. Road is also inquiring for 25 eight-wheel switching locomotives and 40 passenger train cars, including 13 mail and baggage, 13 baggage, 11 passenger coaches, one cafe club coach and two cafe lounge coaches.

Chicago & North Western has ordered 200 ballast cars from Rodger Ballast Car Co. and has made inquiry for 10 4-8-4 type locomotives.

Seaboard Air Line has ordered 200 70-ton hopper cars from Richmond Car Works.

Youngstown Sheet & Tube Co. has ordered 17 air-dump cars of 35-cu. yd. capacity from Koppel Industrial Car & Equipment Co.

Amtorg Trading Corporation, New York, has ordered 20 air-dump cars from Magor Car Co.

New York Central is inquiring for 100 70-ton, high-side gondola cars.

Chicago Great Western is inquiring for 300 automobile cars and 200 box cars.

Lehigh Valley has made inquiry for 500 50-ton hopper cars, 300 50-ton automobile cars and 200 70-ton gondola cars.

Utah Copper Co. is asking for bids on 100 90-ton ore cars and 20 air-dump cars.

Fruit Growers Express has made inquiry for 800 underframes for refrigerator cars in addition to 200 previously mentioned.

Louisville & Nashville has made formal inquiry for 2500 freight cars previously reported as authorized.

Atchison, Topeka & Santa Fe's total inquiries now include 4575 freight cars and 56 passenger cars. This road has placed two dining cars with Pullman Car & Mfg. Corporation and is also inquiring for 21 gas-electric rail-motor cars.

Chicago, Rock Island & Pacific is in market for six gas-electric cars.

Fabricated Structural Steel

New York Subway Will Take 34,000 Tons and Government Building at Washington, 10,000 Tons—Awards of 29,400 Tons

WITH two sections of the New York subway calling for a total of 34,000 tons, and a Government building at Washington for 10,000 tons, new projects reported during the week totaled 58,300 tons. Awards amounted to 29,400 tons, the largest having been 6000 tons for a telephone building at Cincinnati and 5200 tons for a loft building in New York. Awards follow:

NEW YORK, 5200 tons, loft building at Seventh Avenue and Thirty-ninth Street, to Hay Foundry & Iron Works.

NEW YORK, 1300 tons, apartment building at 144 West Eighty-sixth Street, to Easton Structural Steel Co.

NEW YORK, 1000 tons, public school No. 92, to Hay Foundry & Iron Works.

NEW YORK, 900 tons, apartment building at 4 East Seventy-second Street, to Hay Foundry & Iron Works.

NEW YORK, 600 tons, apartment building at Twelfth Street and Fifth Avenue, to Dreier Iron Works.

BALTIMORE & OHIO RAILROAD, 200 tons, bridge, to Fort Pitt Bridge Co.

PARR, S. C., 115 tons, turbine supports bought by W. S. Barstow Management Associates, Reading, Pa., from unnamed builder.

LOUISVILLE & NASHVILLE RAILROAD, 800 tons, bridge construction at Birmingham, to Nashville Bridge Co.

NIAGARA FALLS, N. Y., 800 tons, office building, to McClintic-Marshall Co.

NIAGARA FALLS, 187 tons, addition to National Carbon Co. plant, to R. S. McMannus Steel Corporation.

BUFFALO, 370 tons, reception building for Buffalo State Hospital, to Kellogg Structural Steel Co.

BUFFALO, 300 tons, coach shop for New

York Central Railroad, to Kellogg Structural Steel Co.

WASHINGTON, PA., 150 tons, Y. W. C. A. building, to Guibert Steel Co.

FLINT, MICH., 825 tons, Industrial Mutual Association auditorium, to American Bridge Co.

DETROIT, TOLEDO & IRONTON RAILROAD, 446 tons, bridge at Delta, Ohio, to McClintic-Marshall Co.

TOLEDO, OHIO, 495 tons, New York Central Railroad bridge, to McClintic-Marshall Co.

CLEVELAND, 290 tons, West 117th Street viaduct for New York Central Railroad, to unnamed fabricator.

CLEVELAND, 1250 tons, addition to Moreland Courts Apartments for Shaker Co., to McClintic-Marshall Co.

CLEVELAND, 200 tons, East Thirty-seventh Street bridge for Cleveland Union Terminals Co., to Bethlehem Steel Co.

CINCINNATI, 6000 tons, building for Cincinnati and Suburban Bell Telephone Co., to American Bridge Co.

CINCINNATI, 2000 tons, building for Union Gas & Electric Co., to American Bridge Co.

MICHIGAN CENTRAL RAILROAD, 400 tons, bridges in Indiana, to McClintic-Marshall Co.

CHICAGO, 250 tons, gymnasium for Uni-

versity of Chicago, to an unnamed bidder.

CHICAGO, 1300 tons, armory for 124th Field Artillery, to Mississippi Valley Structural Steel Co.

CHICAGO, 500 tons, addition to Washington Park race track, to United Boiler, Heating & Foundry Co.

MILWAUKEE, 700 tons, building for Allis-Chalmers Mfg. Co., to American Bridge Co.

ST. JOSEPH, MO., 500 tons, bins and sheds for Quaker Oats Co., to St. Joseph Structural Steel Co.

ROSITA, MEX., 1000 tons, buildings for American Smelting & Refining Co., to Ingalls Iron Works.

PARADISE, MONT., 570 tons, Clarks Fork bridge, to Virginia Bridge & Iron Co.

SAN FRANCISCO, 150 tons, Grace Cathedral, to Judson-Pacific Co.

SAN JOSE, CAL., 100 tons, market building, to Golden Gate Iron Works.

SANTA MONICA, CAL., 190 tons, Outlook Building, to Baker Iron Works.

SEATTLE, 200 tons, addition for Isaacson Iron Works, to be fabricated in company's own shop.

STATE OF WASHINGTON, 700 tons, power plant for Stone & Webster, to Pacific Coast fabricator.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

HARTFORD, CONN., 150 tons, building for Trinity College.

NEW YORK, 300 tons, Home for Aged on East Eighty-eighth Street.

NEW YORK, 15,000 tons, section No. 1, route 103 of subway for Houston Street line; bids Dec. 28.

NEW YORK, 19,000 tons, section No. 2, route 3 of subway for Houston Street line; bids Dec. 28.

BROOKLYN, 1000 tons, Pitkin Theater; Thompson-Starrett Co., contractor.

STATE OF NEW YORK, 150 tons, Neversink River highway bridge.

YONKERS, N. Y., 450 tons, showroom and service station.

READING RAILROAD, 6000 tons, steel superstructure for viaduct and bridges for Manayunk grade crossing elimination.

BALTIMORE, 600 tons, highway bridge.

WASHINGTON, 10,000 tons, Internal Revenue Building.

ERIE, PA., 200 tons, Jewish Temple.

SPRINGFIELD, ILL., 1500 tons, State highway bridges.

CHICAGO, 18,500 tons, Board of Trade Building; previously estimated at 15,000 tons.

CHICAGO, tonnage not stated, office building for Swift & Co.

KANKAKEE, ILL., 187 tons, Arcade Building.

SAN RAFAEL, CAL., 250 tons plates, steel tank for Marin municipal water district; bids Dec. 18.

The Timken Roller Bearing Co., Canton, Ohio, has established offices at 1361 Figueroa Street, Los Angeles, and 321 South Pine Street, Seattle, Wash., the former in charge of Roy Cross and the latter of Marshall Cooledge.

Manufacturing operations in motor car and truck factories is continuing at approximately the November rate with some tendency to increase as a larger number of companies swing into production of 1929 models, says *Automotive Industries* this week.

Lower Prices for European Steel

Rapid Resumption of German Mills After Lockout Relieves Tension

—British Pig Iron Demand Better

(By Cablegram)

LONDON, ENGLAND, Dec. 10.

DEMAND for Cleveland pig iron is maintained by domestic consumers asking prompt delivery and some furnaces cannot accept any more orders for delivery this year. Export inquiry is still poor, but prices are firm. In Scotland three Gartsherrie blast furnaces have been blown out, reducing the number of active Scottish furnaces to 20.

East-Coast hematite is moderately active, with stocks small. Prices are being maintained for domestic use, but export buyers are receiving concessions. Foreign ore markets are quiet.

Finished iron and steel business is quiet in the heavy industries, but shipbuilders now are placing many more ship orders, which eventually will benefit the steel makers. The po-

sition otherwise is unchanged and little revival is expected this year.

Tin plate demand has improved, but business generally is quiet. Most makers are well sold for the early months of next year and the position to the end of the current year is being eased by the stoppage weeks, being run off by certain works which are short of immediate specifications.

Galvanized sheet markets are fairly active in small parcels and makers generally are well placed up to January or February. Black sheets are quiet.

On the Continent of Europe

Continental markets are quiet and prices easing, as German production is resumed.

French production in October included 857,000 metric tons of pig iron and 834,000 tons of raw steel (ingots and castings).

however, are booked with sufficient tonnage to carry them through January and are not disposed to offer marked price reductions. Another factor favorable to the mills is the active demand for steel from foreign markets, which will not permit exporters to delay placing their orders for long.

Although the German lockout did not cause an appreciable increase in business, it undoubtedly diverted some business to Belgian mills from foreign buyers who were unable to secure early shipments from Germany.

The market on steel bars is somewhat irregular, as only certain mills are in need of tonnage and in most cases will accept only a limited number of sizes. This necessitates distributing a miscellaneous specification for bars to two or more makers. Prices for export range from £6 3s. to £6 4s. per ton (1.36c. to 1.37c. per lb.) for large orders and from £6 5s. to £6 6s. per ton (1.38c. to 1.39c. per lb.) for small lots and prompt delivery. Most mills are offering January-March shipment.

Corrugated reinforcing bars are quoted at £6 6s. per ton (1.39c. per lb.), and angles are slightly softer, ranging from £5 12s. per ton (1.24c. per lb.) for larger sizes to £6 2s. 6d. per ton (1.35c. per lb.) for small sizes. Hot-rolled hoops are quoted at £6 5s. per ton (1.38c. per lb.), f.o.b. Antwerp. The sheet market is quiet, but heavy gages of black sheets are firm. The light gages continue to encoun-

Belgian Mills Grant Concessions

Prices for First Quarter Delivery Shaded—British Sheets and Foundry Iron Being Imported

ANTWERP, BELGIUM, Nov. 23.—The lockout at the German steel mills failed to bring an increase of business to Belgian mills, which are offering prompt delivery on most products. For future delivery, buyers are pressing for lower prices, and a tendency

to offer concessions on first quarter tonnage is evident. Exporters with orders for future shipments are inclined to delay buying, apparently believing that the present willingness to make concessions presages a lower market level for early 1929. Mills,

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.85 per £ as follows:

Durham coke, del'd.....	£0 17½s.		\$4.24	
Bilbao Rubio ore*.....	1 2	to £1 2½s.	5.34	to \$5.46
Cleveland No. 1 foundry.	3 8½	to 3 9½	16.61	to 16.85
Cleveland No. 3 foundry.	3 6		16.00

(a) Nominal.

ter keen competition from the British product.

Semi-finished material prices are firm, but transactions are few because of limited stocks. The scarcity of blooms has become acute since the German mills withdrew from the market, as previous to the lockout they were practically the only sellers. There is also a scarcity of billets, and prices are nominally £4 19s. to £5 3s. (\$24.06 to \$25.03) per metric ton. Sheet bars are steady in price, but the market is quiet. Transactions are usually at about £5 2s. per ton (\$24.79) for normal specifications.

The export price of No. 3 phosphoric foundry iron continues at 118 Belgas (\$16.40) per metric ton in the domestic market and £3 5s. to £3 6s. (\$15.80 to \$16.04) per ton, f.o.b. Antwerp for export. British Midland furnaces are offering foundry iron at about £3 6s. per ton, c.i.f. Antwerp, or about 116 Belgas (\$16.04), and are securing considerable tonnage from consumers not far removed from the port. Scrap iron and steel prices are firm at 105 Belgas (\$14.60) per metric ton for furnace grade, 104 Belgas (\$14.26) per ton for heavy melting steel for open-hearth and 128 Belgas (\$17.80) per ton for No. 1 cast.

German Tin Plate Output Increasing

HAMBURG, GERMANY, Nov. 23.—German output of tin plate was 13,259 metric tons, or 292,228 base boxes, in October, compared with 11,001 metric tons, or 242,462 base boxes, in the same month of 1927. The October production of tin plate established a new record and is explained in part by an increase in business with British merchants following the Welsh-American tin plate agreement. It is claimed that November would have shown a further increase in tin plate output but for the lockout. The Hoesch Steel Co. plans to increase its tin plate capacity by about 3000 tons, or 66,120 base boxes a month, because of its larger export trade.

German Works Seek South African Ore

HAMBURG, GERMANY, Nov. 24.—Considerable interest in South African manganese ore is being shown by Friedrich Krupp A. G., Essen, and Gutehoffnungshütte, Oberhausen, whose combined imports of manganese ore are about 120,000 tons annually. Both companies are interested in the Gloucester Mining Co., Postmasburg, South Africa, which controls manganese mines. With the completion of a railroad from the mines to the sea, it is planned to ship equipment and give engineering assistance to develop the fields.

Phillips Brothers, Philadelphia, iron and steel importers and jobbers, have moved their offices to the Middle City Building, 34 South Seventeenth Street, that city.

Prices of Imported Steel Recede

Quotations Still Too High for Sales Here—Hearing This Month on Steel Marking

NEW YORK, Dec. 11.—Prices on foreign bars and shapes, c.i.f. Atlantic ports, have registered a slight decline in the past week, following termination of the lockout at German steel mills. The reductions in quotations, however, have only amounted to 1.50c. to 2c. per 100 lb., so that the market is still too high to permit much business with American consumers. Shapes range in price from 1.83c. to 1.85c. per lb., and plain steel bars from 1.95c. to 2c. per lb., duty paid.

The recent decision of the Customs Court of Appeals upholding the lower court in classifying reinforcing bars as structural material, at 10c. per 100 lb. lower duty, has not yet resulted in any competitive offers by importers of Continental material. On a recent inquiry for a sizable tonnage of reinforcing bars, an importer bid about 2.05c. per lb. and the business was placed with a domestic mill quoting \$1.20 per ton higher. Another importer recently offered reinforcing bars on an inquiry for 1000 tons at 2c. per lb., duty paid, but did not receive the business.

Despite the order of the Treasury Department, classifying bar-sized shapes under the bar paragraph of the tariff, taking a 10c. per 100 lb. higher duty than when classified as structural material, importation of furring channels continues, although on a smaller scale. The new classification imposes a duty of 30c. per 100 lb. on furring channels, which cost more than 1.50c. per lb. After the Treasury Department issued its order on bar-sized shapes, domestic manufacturers of furring channels advanced their prices 10c. per 100 lb. to a range of 2.75c. to 2.80c. per lb., but Continental makers have evident-

ly absorbed part of the increased tariff and are meeting the domestic price in most cases.

Importers have entered a protest against the ruling of the Treasury Department on bar-sized shapes, but no date for a hearing has been set.

Several cases of domestic mills against importers intended to clarify the Treasury Department ruling on the marking of imported steel are scheduled for hearing before the Customs Court, New York district, Dec. 18 and 19. It is expected by importers that one such case will be selected as a test. The domestic mills are seeking to determine what products must be marked with the country of origin and how the marking is to be applied.

Export business with the Far East shows some evidence of improvement, but merchant buying continues light, especially from Japan. It is pointed out by Japanese trading companies here that merchants are permitting their stocks to decline because they expect the Government to lift the gold embargo early in the coming year. The resulting increase in the exchange value of the yen would leave them with stocks bought when the yen was low. Consumers, however, are in need of material and are beginning to issue inquiries to the importers. A substantial volume of inquiry for rails is in the market from Japan. The Kongosan Railroad in Chosen is inquiring for 12½ miles of 75-lb. rails, with an alternate inquiry for 60-lb. sections; the Shizuoka Railroad is in the market for five miles of 75-lb. rails, with an alternate inquiry for 60-lb. sections, and two privately owned railroads are asking for rail tonnages, one for 100 miles and the other for 60 miles of 60-lb. rails.

American Machines Bought in Germany

Good Market for Specialized Equipment, But Sellers Must Grant One to Three Months' Credit

A STATEMENT of trade conditions in Germany as they affect the American exporter and manufacturer is given in a communication from John E. Kehl, the United States consul at Stuttgart, to the Merchants Association of New York. The letter says, in part:

"In case you should wish to inform your members as to trade possibilities in the Stuttgart consular district, you may state, on the authority of information from this consulate, that there is a good demand here for articles of all kinds involving or expressing new ideas in design, or for filling purposes not previously fulfilled. The Germans are very quick to appreciate the merits of something new in the market, something which

accomplishes a purpose not previously met or which is an improvement over articles of like kind. This is especially true of machinery and automotive equipment which embodies new ideas in design or efficiency.

"The German manufacturers of machinery are usually able to produce their machines more cheaply than American machines of similar kind can be delivered in this district. However, the great interest manifested in Germany in the highest possible degree of mechanization of industry makes the German market particularly receptive to offers of any kind of machines that will do something for which there are no German machines available, or which will do the work better or faster or more cheaply

than any German machine. This is especially true in the wood-working and metal-working branches. To a certain extent it is true in the textile industry, which is highly important in this district. The Daimler Motor Works at Stuttgart-Undertuerkheim has perhaps 20 or 30 large and expensive machines imported from the United States. A considerable number of knitting mills in Württemberg and Baden have American machines.

"The general practice in sales of goods in Germany is for the dealer to receive from the manufacturer from 30 to 90 days' credit without interest and a discount of 2 to 4 per cent if he pays within 10 to 30 days. These terms are somewhat more lenient than American manufacturers are accustomed to giving. It often happens, therefore, that prospective German customers lose interest in American offers when they find that they must pay cash against documents in the United States for any goods they buy. This means for them paying for goods about 30 days in advance of receipt. Where it is possible for American exporters to offer terms in compliance with the practice in Germany it will be advisable for them to do so. It is all very well to insist on prompt payments or short credits in a market which is accustomed to it, but when the same insistence is used in approaching merchants in a territory like this, where long credits are the usual rather than the exceptional thing, there is a great danger that the foreign merchant will take this insistence as a reflection on his good standing. There is also a strong possibility that such insistence will end all likelihood of doing business with him."

French Pig Iron Entente To Be Renewed

WASHINGTON, Dec. 11.—It is reported that the entente composed of the several producers of phosphorus pig iron in France, which was to expire Dec. 31, is to be renewed for two years under unchanged terms, according to a cablegram received by the Department of Commerce from Commercial Attaché H. C. MacLean, Paris.

It has also been reported that the international phosphorus pig iron entente, embracing producers in France, Belgium and Luxemburg, will, in all probability, be renewed for a similar period.

Henry Ford has purchased machine shop and business of Charles E. Angell, 223 Aborn Street, Providence, R. I., and will install some of the equipment and records of the Providence firm in his museum of varied Americana at Dearborn, Mich. The shop is probably one of the oldest in New England, but was of particular value to Mr. Ford because of early records pertaining to motive power engine parts which were made by Mr. Angell.

New Arbitrator in German Dispute

Minister of Interior Accepted by Both Factions—Mills Rapidly Resuming Operations

TERMINATION of the lockout in the Ruhr steel mills did not settle the questions at issue; it merely indicated that both the mills and the unions again accepted Government arbitration. The original decision of the Government arbitrators granted an increase of 6 pf. (1.50c.) per hr. to time workers and 2 pf. (0.50c.) per hr. as a "time supplement" to piece workers. The mills refused to accept this finding, contending that it was invalid, as it did not come from a properly constituted authority. The mills were upheld by the courts, and the lockout did not come to an end until Dec. 3, following the appointment of Minister of the Interior Severing as the new arbitrator and his acceptance by both sides. A decision by the new arbitrator is not expected for at least one week, and a number of weeks may elapse before his investigation is completed.

According to a cabled report to the Department of Commerce from Commercial Attaché Fayette W. Allport, Berlin, the Federal Labor Court will, at a later date, bring in a verdict as to the legality of the decision of Minister of Labor Wissell, who, on Oct. 31, held that the wage awards that precipitated the lockout were binding on both parties.

The German steel industry is rapidly resuming activity. About four-fifths of the mills affected by the lockout are operating, more men are being employed daily, and new furnaces are being started. The resumption of production has affected Continental steel prices. The trend of export prices is downward, after a slight advance during November when the lockout was effective. It is reported that the volume of orders on the books of German steel works is sufficient to sustain operations for the next three months.

Neither the mills nor the unions have changed their attitude regarding the issues that caused the lockout. Employers continue to protest that they wish to avoid a new advance in prices, which would be the third this year in the domestic market, and that a wage increase would make such an advance inevitable. The average wage of skilled workers in the metal industries is 48.89 m. (\$11.65) per week. This is the minimum, as most steel workers receive extra payments, if married, or for overtime work. The increase in wages of 15 pf. (4c.) per hr. originally demanded by the unions would cost the metal industry about 90,000,000 m. (\$21,438,000) a year.

Annual reports of leading mills, however, do not substantiate the employers' claim that their finances are unsatisfactory and that they are unable to pay an increase with their present income. The turnover of business at the Gutehoffnungshütte at

Oberhausen increased 10 per cent in 1927, but its gross profits increased 25 per cent. Other corporation reports also show satisfactory financial conditions. The average dividend of the heavy iron and steel corporations is slightly higher than the average for all corporations in Germany.

World Engineering Congress Plans Outlined

The World Engineering Congress, to be held in Tokio, Japan, next year, was given a decided impetus by a dinner meeting of the American committee on Dec. 6 at the Engineers' Club, New York, at which Dr. Masawo Kamo, professor of mechanical engineering at Tokio Imperial University, was the guest of honor. Doctor Kamo, who is chairman of the organizing committee of the congress, told in detail what is being arranged for the entertainment and comfort of visitors and outlined active participation of some principal countries of Europe.

It was, however, in the reports of the chairman of the American subcommittees that the information became available as to the growing interest being shown within the United States toward the congress and the numbers who are planning to participate. Among those committees reporting were: Finance, John W. Lieb, chairman; publicity, James H. McGraw, chairman; transportation, F. B. Jewett, chairman; promotion and attendance, George W. Fuller, chairman. Elmer A. Sperry, chairman of the American committee and now president of the American Society of Mechanical Engineers, presided, and details were also explained by Maurice Holland, executive secretary of the committee, 29 West Thirty-ninth Street, New York. The American Express Travel Bureau will have charge of the arrangements and one of the Dollar Line steamships leaving San Francisco has been chartered.

Manitowoc Ship Building Corporation, Manitowoc, Wis., has been given a contract by the Pere Marquette Railroad to construct two new car ferries at a cost of \$2,500,000. The new ferries will be the first on the Great Lakes to employ turbo-electric drive. It will make them the fastest ferries and among the fastest ships on the Lakes, with a speed of 18 miles an hour specified.

The turntable of permanent molds shown on page 1223 of THE IRON AGE of Nov. 15, in an article devoted to the manufacture of electric heating appliances by the Edison Electric Appliance Co., Chicago, carried molds made by the Holley Permanent Mold Machine, Inc., Detroit.

Working on Small Tool Standardization

Progress was reported by 12 technical committees and new projects were discussed at a meeting of the sectional committee on the standardization of small tools and machine tool elements, which was held Dec. 6 at the Engineering Societies Building, New York. The sectional committee is organized under the procedure of the American Standards Association, and is sponsored by the National Machine Tool Builders Association, Society of Automotive Engineers and the American Society of Mechanical Engineers.

H. E. Harris, consulting engineer, Bridgeport, Conn., chairman of the committee, presided at the meeting, which was well attended. Brief addresses, dealing for the most part with the desirability of the standardization projects in hand, were made by J. B. Armitage, chief engineer Kearney & Trecker Corporation, Milwaukee, representing the N. M. T. B. A.; D. W. Oviatt, chairman of tool standards committee, General Motors Corporation, representing the S. A. E.; and J. R. Shea, superintendent of manufacturing development, Western Electric Co., New York, representing the A. S. M. E.

Technical committee No. 1 has completed its work, standards for T-slots, their bolts, nuts, tongues and cutters having been approved March, 1927. Tool holder shanks and tool post opening standards have passed the sectional committee and sponsor organizations and are now before the American Standards Association. The preliminary work of the milling cutter committee, which is made up of eight sub-committees headed by C. W. Machon, Brown & Sharpe Mfg. Co., Providence, has been practically completed.

Progress in Taper Shank Standards

Standardization of machine taper shanks and sockets, an outstanding project, has made considerable progress. This committee, headed by E. F. DuBrul, general manager of the National Machine Tool Builders Association, is in a position to submit two propositions to industry: a taper of $\frac{3}{4}$ -in. per ft. for all sizes, and a compromise, with Morse taper for smaller sizes and $\frac{3}{4}$ -in. taper for larger sizes. The committee on designation and working ranges of machine tools held its first meeting Dec. 5, with H. W. Dunbar, Norton Co., Worcester, chairman. Mr. DuBrul, reporting for the committee, pointed out that the grinding machine group of the N. M. T. B. A. has been working on this for a number of years and has standardized on many classes of grinders. Milling machine, lathe and other groups have also worked along this line.

Standardization of chucks and chuck jaws will be taken up by a technical committee headed by J. R. Lovely, Jones & Lamson Machine Co., Spring-

field, Vt. The committee, composed largely of chuck manufacturers, is made up of two sub-committees, one on scroll chucks and the other on air chucks. Another sub-committee will take up bolt holes on air cylinders, and connections on piston rods, etc. The main committee is working in chuck jaw standards.

The committee on spindle noses and collets for machine tools, of which J. B. Armitage, Kearney & Trecker Corporation, Milwaukee, is chairman, reported progress. S. Diamant, president of the Diamant Tool & Mfg. Co., Newark, N. J., is permanent chairman of a committee on punch and die holders, and a committee on circular forming tools is being organized with T. A. Anglada, Anglada Motor Corporation, New York, chairman. This standardization project was suggested by the S. A. E.

Simplification and standardization of drill sizes is to be undertaken by a committee headed by C. J. Oxford, National Twist Drill Co., Detroit. At the first meeting, held Dec. 5, a sub-committee was appointed to prepare a tentative list of drill sizes. A drill jig bushing committee, with C. E. Rundorff, Buick Motor Co., Flint, Mich., chairman, has also been organized.

Standardization of machine tool colors and paint materials was suggested for consideration by the sectional committee, this project being introduced by E. F. DuBrul. After some discussion as to whether the project is within the scope of the committee, it was voted to refer the matter to the American Standards Association. Standardization of location of serial numbers on machine tools was also suggested.

The consensus of opinion was that this project does not come within the scope of the committee and it was voted to refer the matter to the N. M. T. B. A. Standardization of dies for electric spot welders was suggested by R. S. Burnett, manager standards department of the S. A. E., at the request of a large maker of motor trucks. Users of such equipment are to be circularized and if a substantial interest is found, the executive committee will add this to the list of standardization projects. Butt, as well as spot, welding dies will be included.

Julian Kennedy Awarded A.S.M.E. Medal

Julian Kennedy, Pittsburgh, was awarded the A.S.M.E. medal for 1928 for "services and contributions to the iron and steel industry." The presentation was made as a feature of the dinner of the American Society of Mechanical Engineers, New York, Dec. 5. He was presented to the members for the award by Charles M. Schwab, past-president of the society, and the actual presentation of the medal was made by President Alex Dow. Mr. Kennedy, in an interesting acceptance speech, which re-

counted some of the conditions which used to obtain in the industry, emphasized something of the difficulties, particularly in the early days, of introducing new methods of equipment into the mills, saying that "it was harder to get them in use than to work them out."

Scrap Institute Holds First Meeting and Dinner

The first meeting and dinner of the recently organized board of directors of the Institute of Scrap Iron and Steel was held Dec. 5, at the Hotel Pennsylvania, New York. Announcement was made by Benjamin Schwartz, director of the Institute, of the organization of arbitration machinery to settle disputes within the iron and steel scrap industry, available to members and non-members upon application for the service. The rules adopted conform to the arbitration laws of the State of New York and other states which have passed such statutes and were prepared with the aid of the American Arbitration Association. According to these rules, the director of the Institute will be the impartial chairman in every arbitration, two arbitors being selected from a fixed panel by the parties to the dispute.

In addition to the seven chapters of the Institute already organized in Pittsburgh, Buffalo, Philadelphia, New York, Newark, N. J., Reading, Pa. and Hartford, Conn., it was decided to establish new chapters in Cleveland, Detroit, Chicago, St. Louis and Boston. The board of directors also voted to organize four departments of service devoted to trade relations, arbitration, insurance and traffic.

At the dinner, Dr. Hugh P. Baker of the Chamber of Commerce of the United States, Washington, spoke on trade associations and their growth in the United States, explaining how the trade association department of the Chamber of Commerce of the United States is extending aid to recently organized associations.

The following officers were elected to serve until the annual meeting in March: Joseph G. Hitner, Henry A. Hitner's Sons Co., Philadelphia, president; David Strauss, Continental Iron & Steel Co., New York, B. Cohen, Louis A. Cohen & Sons, Wikes-Barre, Pa., Stanton Dreifus, S. Snyder Corporation, New York, J. V. S. Bishop, Bishop Co., Philadelphia, and David Pollock, Mayer Pollock, Pottstown, Pa., vice-presidents; Herman D. Moscowitz, M. Samuel & Sons, New York, secretary, and Thomas F. Kelly, Brooklyn, treasurer.

The executive committee includes: Max Meltzer, Hausman & Wimmer Co., Pittsburgh; Michael Bonomo, L. Schiavone & Bonomo Brothers, Jersey City, N. J.; Allan Hoffer, Allan Hoffer Co., Philadelphia; N. Jacobs, Buffalo House Wrecking & Salvage Co.; I. Wilkoff, Wilkoff Co., Youngstown, and Morris Spear, Rotter, Spear Co., Cleveland.

Machinery Markets and News of the Works

December Business Lighter

Machine Tool Buying Affected by Year-End and Holiday Considerations—Outlook Still Promising

MACHINE tool buying this month has declined in all markets. Although the volume of inquiry has dropped off along with a reduction in sales, the outlook continues promising for good business early in the new year. Year-end inventory considerations, the approach of the holidays and the desire of many manufacturers to await the new year for the formulation of business plans are perhaps responsible for the check in purchases.

It is apparent that the final month of this year will run ahead of December, 1927, but this comparison loses some force in view of the fact that sales throughout all of this year have outstripped those of corresponding months in the previous year.

New York

NEW YORK, Dec. 11.—Inquiries for machine tools continue in fair volume, although scattered and for the most part for single tools. An inclination to delay buying until next year is beginning to develop in some cases. Except for the purchase of a few tools by the New York Central Railroad, including two upright drills, the railroads are inactive. The General Electric Co. has closed on several tools including three 12-in. engine lathes for use at Schenectady. No action has been taken as yet on the list of 16 tools for the Department of Public Instruction, Schenectady, N. Y. With shipbuilders bidding for the construction of more tonnage than for a number of years, some sellers of machine tools foresee the possibility of small business from this source in lathes, planers, drills and milling machines.

Post Radio & Electric Corporation, New York, has leased space in building at 135 Bleeker Street, to manufacture radio equipment and apparatus.

Weihl Brothers, Brooklyn, care of Tobias Goldstone, 26 Court Street, architect, have asked bids on general contract for new foundry, to cost about \$27,000 with equipment.

Board of Education, 500 Park Avenue, New York, is said to be planning instal-

Requirements of automobile companies in the first quarter are expected to be substantial. At Chicago, the International Harvester Co. and the Allis-Chalmers Mfg. Co. are still buying, and lists of the Buda Co. and the Whiting Corporation, both of Harvey, Ill., are active. At Cleveland, the Eaton Axle & Spring Co. is adding to recent heavy purchases.

Several hundred used machine tools have been thrown on the market at Detroit through the consolidation of Dodge Brothers with the Chrysler Corporation. The old equipment is being disposed of to balance production.

An order for 10 turret lathes for a manufacturer in Sweden was placed with a Cleveland builder.

lution of manual training department in three-story John Adams High School to be erected at Woodhaven, L. I., to cost about \$2,000,000, for which bids have been asked on general contract. W. C. Martin, Flatbush Avenue Extension and Concord Street, Brooklyn, is architect.

Bushwick Can Co., 86 Butler Street, Brooklyn, manufacturer of tin cans and boxes, etc., has awarded general contract for one-story factory, to cost about \$45,000 with equipment. V. A. Lacerenza, 26 Court Street, is architect.

Anaconda Copper Mining Co., 25 Broadway, New York, has plans for two central power plants for mining properties in Butte, Mont., district, replacing a number of stations now used for this service.

James W. Garside, president, DeForest Radio Co., 139 Franklin Street, Jersey City, N. J., and associates, have organized Jenkins Television Corporation, with capital of \$10,000,000, to manufacture television and radio equipment and devices. Company will take over Jenkin's Laboratories, Inc., Washington, manufacturer of motion picture projectors, and equipment for transmission of motion pictures by radio or wire. It is understood that plant will be established in New York district. Mr. Garside will be president and general manager; C. Francis Jenkins is vice-president in charge of research. Company has arranged for stock issue to total \$2,500,000, portion of fund to be used for development.

Port of New York Authority, 75 West Street, New York, will soon begin super-

structure for new multi-story testing laboratory for structural steel and other steel products in connection with proposed Hudson River bridge, between Fort Lee, N. J. and Fort Washington Park, and bridge over Kill van Kull, between Bayonne, N. J., and Port Richmond, S. I. It will be located at West Side Avenue and Fox Place, Jersey City, N. J., and will cost about \$300,000 with equipment.

Eastern New Jersey Power Co., Asbury Park, N. J., operated by Utilities Power & Light Corporation, 327 South La Salle Street, Chicago, has acquired 45 acres at Sayreville, N. J., and plans new steam-operated electric power plant with initial capacity of 60,000 kw., to cost about \$5,000,000 with turbo-generators and auxiliary equipment. Later capacity will be increased to 180,000 kw. A coal storage plant of 60,000 tons capacity, with mechanical handling facilities, will be provided.

U. S. Hammered Piston Ring Co., 1222 South Grove Street, Irvington, N. J., has plans for new works near Paterson, N. J., for production of piston rings for aircraft engines, to cost more than \$350,000 with equipment. It is understood that present works will be removed to new location. Company has work under way on new plant at St. Petersburg, Fla., for production of piston rings for automobile engines. Sale of stock amounting to \$800,000 has been arranged, portion of fund to be used for expansion. Albert W. Wenzel is president.

Metals Disintegrating Co., Townley, near Elizabeth, N. J., has approved plans for two-story and basement addition, 53 x 100 ft., to cost about \$40,000 with equipment. William L. Finne, 91 Broad Street, Elizabeth, is architect.

National Aero Corporation, care of Perth Amboy Airplanes Corporation, Market Street, Perth Amboy, N. J., has leased plant of last-noted organization, now in course of construction, for manufacture of air-cooled aircraft motors, including parts and assembling departments. Buildings are scheduled for completion early next year and will provide about 50,000 sq. ft. floor space. National company was formed recently with capital of \$1,000,000 and is headed by Everett S. Cameron, president, and Eldridge M. Roberts, secretary.

Koppen Metal Products, Inc., formerly at Union City, N. J., is now located in new plant at Carlstadt, N. J., and may be addressed at P. O. Box 37.

William H. Nicholls Co., Inc., formerly at 4 College Street, Brooklyn, has removed to Ninety-first Avenue and 126th Street, Richmond Hill, N. Y.

Severin Machinery Corporation, 30 Church Street, New York, has taken over good will and business of Severin-Strafer Machinery Corporation.

National Flue Cleaner Co., Inc., Groveville, N. J., maker of soot blowers and fire tube boilers, has appointed the following representatives: McGee Sales Agency, 75 Fremont Street, San Francisco; Flickinger, Meyers & Rudolph, 129 West Second Street, Los Angeles; Manufacturers Sales Service, Box 655 Salt Lake

The Crane Market

OVERHEAD crane buying continues small and current inquiries are in most cases for single pieces of equipment. Sellers of electric and hand power hoists report continued good demand, but no large lists. Interest in locomotive cranes has slackened with the approach of winter weather, but contractors are still in the market for power shovels for tunnel and other contracts. Standard Oil Co. of Louisiana will buy a 150-ton, 30-ft. span overhead electric crane with two 25-ton auxiliary hooks for an experimental station at Baton Rouge, La. Nashville

Bridge Co., Nashville, Tenn., is planning installation of 25 ton, 60-ft. span electric traveling crane.

Among recent purchases are:

American-Chatillon Co., 393 Seventh Avenue, New York, nine small overhead cranes for Rome, Ga., six 1-ton hand power cranes with electric hoists, one 2-ton hand power crane, one 4-ton and one 6-ton crane with electric hoists, from Florandin Equipment Co., New York, agent for H. D. Conkey & Co., Mendota, Ill., and American Engineering Co., Philadelphia.

Amtorg Trading Corporation, 165 Broadway, New York, 10 50-ton locomotive cranes for export to Russia from Industrial-Brownhoist Corporation.

Missouri Pacific has ordered an overhead electric crane from Harnischfeger Corporation.

Western Electric Co., Chicago, has placed order for an overhead traveling crane with Whiting Corporation.

White Motor Crane Service, Detroit, has purchased a gasoline-operated crawler type crane from Orton Crane & Shovel Co.

City, Utah, and W. A. Ramsey, Ltd., Honolulu, Hawaii.

Lockstrip Mfg. Corporation, 36-09 Vermon Boulevard, Long Island City, N. Y., has been organized to take over manufacture of T. M. C. lockstrips for terrazzo and cement work. Plant is built and fully equipped and company is in operation.

National Cash Register Co., Dayton, Ohio, is permitted to acquire all capital stock of Ellis Adding Typewriter Co., Newark, N. J., under order of United States District Court in southern Ohio. Court held that transaction would not violate injunction decree against company granted in 1916 in Federal Government's anti-trust suit.

Gesswein Boat Corporation, Bergen Beach, Brooklyn, has been organized to operate boat building and repair works and has taken over plant of Paul S. Gesswein Boat Co. It will manufacture outboard motor boats and will be in market for equipment and supplies, including brass fastenings, lumber and deck fittings. Robert M. French is treasurer and general manager.

New England

BOSTON, Dec. 10.—The majority of local machine tool dealers report little current business. The most important transactions included four machines with an aggregate value of \$35,000, four lathes and four single-spindle sensitive drills. Used tools sales included about a dozen tool room lathes, three shapers, and other equipment. Unquestionably more machine tools have been sold, but because of keen competition among dealers details are lacking. Firms which have bought equipment have more tools under consideration. A Connecticut machinery maker in November bought at least \$105,000 of machine tools, a machinery maker in Rhode Island purchased heavily last month and another Rhode Island company bought three Brown & Sharpe milling machines. It is also reported that a Worcester, Mass., machinery maker placed substantial orders.

New inquiries are coming in slowly, partly because of the nearness of inventory time and also because most users needing equipment cannot secure prompt deliveries and have decided to await developments. Machine tool dealers, however, feel certain that business will be good in January and possibly in later months.

That New England plants are busier than in many months is indicated by the increase in consumption of small tools. December started with prospects

of a new high monthly sales record and has kept up the pace.

Cutting Die & Machine Co. of America, a Massachusetts corporation with 25,000 shares of no par value stock outstanding, has been organized to take over business of Joseph E. Knox & Co., Inc., Lynn, Mass., O. M. Savels & Co., Worcester, John Dewes-Gumbs Die Co., New York, and Boston Die Co. and Hub Schrivving Knife Co., Boston. These companies manufacture cutting dies for shoes and leather, rubber, celluloid, collars and shirts, envelopes, etc., perforating dies for shoe novelties, rubber trimming knives and extruding rubber form dies. James V. Knox, president Joseph E. Knox & Co., Inc., is president and general manager of new company. Present plants will be operated without change in management and will be expanded.

Work has started on a new plant for American Tube & Stamping Co., Stratford Avenue, Bridgeport, Conn.

Everett Auto Parts Co., 234 Everett Avenue, Chelsea, Mass., has awarded a contract for a one-story machine shop, 40 x 100 ft.

Plans are in progress for a new coal yard for John R. White & Son, Gano Street, Providence, R. I., to replace one destroyed by fire last week. Hoisting and other equipment will be required.

Brooks-Skinner Co., Adams Street, Quincy, Mass., wood and steel portable and permanent buildings, has started work on an addition. Plans for 1929 call for an increased production of about 25 per cent.

Wallace Barnes Co., Bristol, Conn., manufacturer of springs, special screw machine products, etc., is arranging an expansion program, with new buildings to total about 200,000 sq. ft. additional floor space. New unit will also be built at branch plant at Forestville, providing about 16,000 sq. ft. floor space. Project will cost over \$400,000 with equipment.

American Paper Tube Co., Hazel Street, Woonsocket, R. I., has asked bids on general contract for one-story addition, to cost about \$45,000 with machinery. W. F. Fontaine, 285 Main Street, is architect.

Sikorsky Mfg. Corporation, College Point, L. I., N. Y., manufacturer of airplanes and parts, will soon take bids on general contract for new plant at Lordship, Stratford, Conn., consisting of main one-story unit, 300 x 400 ft., with adjoining two-story building, 50 x 150 ft., to cost more than \$400,000 with machinery. Company is said to be planning removal of College Point works to new location. Fletcher-Thompson, Inc., Bridgeport, Conn., is architect and engineer.

Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, Conn., architect and engineer, has plans for one-story automobile service, repair and garage building, 65 x 250 ft., at Norwalk, Conn., to cost about \$120,000 with equipment.

Wilcox Crittenden & Co., Middletown, Conn., manufacturers of marine hardware, inform THE IRON AGE that they have not let contract to Lockwood Greene Engineers, Inc., for plant addition, as reported in our issue of Nov. 15.

Philadelphia

PHILADELPHIA, Dec. 10.—Contract has been let by Atwater Kent Mfg. Co., Philadelphia, to William Steele & Sons Co., for one-story sawtooth roof addition, with part three stories, 515 x 900 ft., to cost over \$1,000,000 with machinery. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

Thomas Halton's Sons, Mascher Street, Philadelphia, manufacturers of silk mill machinery, parts, etc., have awarded general contract to E. E. Hollenback, Inc., 1910 North Marshall Street, for one-story machine shop, 69 x 240 ft., to cost more than \$100,000 with equipment. W. E. S. Dyer, Land Title Building, is architect and engineer.

Philadelphia Air Terminal, Inc., care of Andrew S. Webb, president, S. B. & B. W. Fleisher, Inc., Twenty-fifth and Reed Streets, Philadelphia, recently organized by Mr. Webb and associates, has acquired 125 acres at South Philadelphia as site for new airport, to consist of hangars, machine and repair shops, oil storage and other units, project to cost about \$2,500,000.

Philadelphia Nonferrous Foundry Co., Philadelphia, recently organized by Edward W. Taylor, Jr., 3030 Queen Lane, and associates, has acquired two-story factory at 811-15 Fairmount Avenue, 56 x 125 ft., for production of aluminum, brass and other metal castings.

Pennsylvania Flexible Metallic Tubing Co., Broad and Race Streets, Philadelphia, has asked bids on general contract for an addition to plant at Seventy-third Street and Elmwood Avenue, to cost over \$50,000 with equipment. William H. Cookman, 420 West Price Street, is architect.

Crew Levick Co., 219 North Broad Street, Philadelphia, refined oils, gasoline, etc., will rebuild part of refining still department on Pettys Island, Delaware River, destroyed by fire Dec. 4.

American Dredging Co., foot of Division Street, Camden, N. J., has acquired waterfront property at Gloucester, N. J., and plans construction of new barge and dredger shipyard, primarily for repairs to

company equipment, including general mechanical works, one-story machine shop, and marine drydock railroad, to cost over \$150,000 with equipment. Present works will be removed to new location and capacity increased.

T. J. Cope, 2114 Sansom Street, Philadelphia, manufacturer of electrical equipment, has purchased two-story factory on site, 41 x 110 ft., for new plant.

Board of Education, Allentown, Pa., is said to be planning installation of manual training equipment in three-story addition to Raub junior high school, to cost \$200,000, for which plans will be drawn by Jacoby & Everett, Commonwealth Building, architects.

York Heating & Ventilating Corporation, Sixteenth and Sansom Streets, Philadelphia, manufacturer of heating and ventilating equipment, is considering new plant unit at Bridgeport, Pa., to cost about \$50,000.

Hobson Flatware Co., Lansdale, Pa., manufacturer of nickel-plated and chromium-plated ware, has awarded general contract to Bailey Brothers, Doylestown, Pa., for new plant on 3-acre tract at Lambertville, N. J., recently acquired, consisting of two units, one story, 120 x 160 ft., and two stories, 40 x 160 ft., to cost more than \$75,000 with equipment.

Pennsylvania Forge Co., Philadelphia, has removed main office to new plant at Milnor and Bleigh Streets, Tacony, Philadelphia.

Hindley Gear Co., Philadelphia, has removed offices and shop from 1105 Frankford Avenue, to 508 North Nineteenth Street.

Art Metalabel Corporation, Baptist Avenue and Pennsylvania Railroad, York, Pa., has been organized to manufacture metal seals and name plates. Company has leased manufacturing building and initial materials have been purchased. Production is expected to begin first of year.

Pittsburgh

PITTSBURGH, Dec. 10.—Machine tool sales are in smaller volume than in November, which is not unusual at this time of year when the tendency among buyers is to let purchases go over into a new year. Prices are out on many inquiries and it is believed that the majority will materialize into orders.

Property has been acquired at Meadville, Pa., by Erie Railroad Co., 50 Church Street, New York, for new locomotive terminal, including mechanical coaling plant and other facilities, to cost about \$150,000.

Mackintosh-Hemphill Co., foot of Twelfth Street, Pittsburgh, manufacturer of rolling machinery, parts, etc., has awarded general contract to Hughes-Foulkrod Co., Schoff Building, for one-story unit at Wooster, Ohio, to cost about \$80,000 with equipment.

Standard Seamless Tube Co., 313 Sixth Avenue, Pittsburgh, is said to have plans under way for addition to mill at Ambridge, Pa., to cost over \$350,000 with equipment. H. M. Wharton is company engineer.

Sinclair Glass Co., Vanvoohis, W. Va., manufacturer of automobile and flashlight lenses, etc., has leased building at Huntington, W. Va., totaling about 50,000 sq. ft. floor space, for new branch plant.

Armstrong Cork Co., Twenty-fourth Street, Pittsburgh, is said to be planning

three-story addition to plant at Gloucester, N. J., to cost more than \$75,000 with equipment. H. Boettcher is company architect and engineer.

McCoy-Brandt Machinery Co., 50 Penn Avenue, Pittsburgh, has changed name to Brandt Machinery Co.

Detroit

DETROIT, Dec. 10.—Federal Motor Truck Co., 5780 Federal Avenue, Detroit, will soon take bids for two-story addition, to cost over \$200,000 with machinery. F. J. Winter, Book Tower Building, is architect.

Hutto Engineering Co., 515 Lycaste Avenue, Detroit, manufacturer of grinding machinery, has awarded general contract to H. C. Wright Building Co., Detroit, for one-story addition, to cost about \$50,000 with equipment.

Continental Ice Co., 7744 Jeffery Avenue, Chicago, has plans for new two-story ice-manufacturing and refrigerating plant, 85 x 340 ft., at Port Huron, Mich., to cost more than \$175,000 with machinery.

Muskegon Motor Specialties Co., Muskegon, Mich., recently organized to take over company of same name and L. O. Gordon Mfg. Co., both with local plants, specializing in production of cam shafts for internal combustion engines, has arranged for a stock issue of about \$1,943,000, part of proceeds to be used for merger and expansion in production.

City Council, Cadillac, Mich., has secured tract of 160 acres for municipal airport, and plans early construction of hangars, machine and repair shop, oil storage building and other units.

Robinson Marine Construction Co., West Main Street, Benton Harbor, Mich., has awarded general contract to M. W. Stock Construction Co., St. Joseph, Mich., for branch ship repair yard at St. Joseph, consisting of two units, 50 x 100 ft., and 50 x 65 ft., and auxiliary structures, to cost about \$70,000 with equipment.

Defender Mfg. Co., Allegan, Mich., manufacturer of automobile bumpers, has authorized an expansion program to double present capacity, to cost about \$50,000 with equipment.

Foster Airways, Inc., Lafayette Building, Detroit, is considering extensions in airport near Dearborn, Mich., including construction of additional hangars and mechanical buildings, to cost about \$150,000. F. M. Foster is president.

Consumers Power Co., Jackson, Mich., has arranged for a bond issue of \$11,415,000, part of proceeds to be used for expansion and improvements.

City Council, Allegan, Mich., has completed plans for municipal hydroelectric generating plant on Kalamazoo River, to cost about \$400,000 with transmission system, and is said to be planning early call for bids. Ayres, Lewis, Morris & May, Cornwall Building, Ann Arbor, Mich., are engineers.

Fruehauf Trailer Co., 10940 Harper Avenue, Detroit, manufacturer of two and four-wheel motor trailers, has awarded general contract to Edward Butler, Detroit, for two additional stories on present factory, to cost more than \$85,000 with equipment.

La Salle Tool & Gauge Co., Inc., 1310 Maple Street, Detroit, has been organized to manufacture jigs, fixtures, fine tools and gages. At present manufacturing will be done by contract and later com-

pany will be in market for additional machinery and equipment. Charles F. Lau is general manager.

Cleveland

CLEVELAND, Dec. 10.—While machine tool sales show a little slowing down this month, December has started with an exceedingly good volume of business. There was considerable scattered buying of single machines in the northern Ohio territory during the week. An export order for 10 turret lathes for Sweden was placed with the Warner & Swasey Co. by a large electrical manufacturing company in that country. The Eaton Axle & Spring Co., Cleveland, which recently was a heavy buyer of machinery, has some additional equipment to place. The Murray Ohio Mfg. Co., Cleveland, during the week purchased a large toggle drawing press. The volume of business in presses recently has been heavy, although orders mostly are for single machines.

The merger of Dodge Brothers plant in Detroit with the Chrysler Corporation has resulted in the placing on the market of several hundred used tools in the Dodge plant, which are being disposed of with a view of balancing production. This surplus machinery is being offered by a Detroit dealer.

Swartwout Co., Cleveland, has purchased plant of Cleveland Milling Machine Co., 18511 Euclid Avenue, part of which it has been occupying as a tenant, and will shortly occupy entire plant, providing 90,000 sq. ft. of floor space and covering a 7-acre site. Company has moved to Cleveland business of S-C Regulator Co., Fostoria, Ohio, which it has purchased, and plans in the next few months to move its Orrville, Ohio, plant to Cleveland, thereby centralizing its production at one point. Company's products include industrial ovens and ball bearing ventilators. D. K. Swartwout, Sr., is president; D. K. Swartwout, Jr., vice-president, and W. E. Clement, secretary and treasurer.

Ideal Bronze Co., 1265 East Fifty-fifth Street, Cleveland, has been consolidated with Wellman Bronze Co., 6017 Superior Avenue, Cleveland, giving latter company an annual capacity of 2,000,000 lb. of rough, finished and semi-finished bronze and aluminum castings. Plant of Ideal company will be closed. F. H. Zwilling, president-treasurer and E. V. Coulston, secretary of Ideal company, have become associated with Wellman organization.

W. S. Tyler Co., Cleveland, has acquired a 15 acre site at St. Catherine's, Ont., for erection of a plant to supply its Canadian trade. Company's products include woven wire screens, ornamental wire and bronze.

National Lamp Works of General Electric Co., Nela Park, Cleveland, is planning one-story addition, 80 x 100 ft., to cost about \$50,000 with equipment.

National Acme Co., Coit Road and East 131st Street, Cleveland, manufacturer of automatic screw machines, etc., is said to be planning one-story addition to cost over \$75,000 with equipment.

City Board of Control, Akron, Ohio, has authorized immediate construction of new municipal airport, to cost more than \$750,000 with hangars, repair and reconditioning shops and other units.

Lee Krueger, president, Superior Holding Co., Fidelity Building, Cleveland, has approved plans for two-story automobile service, repair and garage building, 65 x 150 ft., to cost about \$150,000 with equipment.

Board of Education, Fremont, Ohio, is said to be planning installation of manual training equipment in new two-story junior high school, to cost about \$225,000. S. H. Shively, Logan Block, is architect.

Cincinnati

CINCINNATI, Dec. 10.—Machine tool bookings have declined somewhat in the past week and indications are that business in December will fall considerably short of that in each of the three previous months. However, the flow of orders has been fairly substantial and the month is certain to make a better showing than December, 1927. The volume of inquiries has slackened, but still holds up to a good level. Although sales in the Detroit district have fallen off, automobile companies are buying some equipment, and their requirements in the next few months are expected to reach large proportions.

Machine tools executives are of the opinion that purchases of tools are likely to be only fair until after the holiday season. Local plant operations have been well sustained and in some cases night shifts are necessary to satisfy demand for reasonably early deliveries.

A Philadelphia company is in the market for six 24-in. and four 20-in. lathes. A Cincinnati builder has taken an order for two engine lathes to be shipped to Persia. The Norfolk & Western is reported to have bought additional tools on its recent list, but the Southern has not yet closed on its inquiry.

G. & G. Mfg. Co., 3116 Spring Grove Avenue, Cincinnati, manufacturer of dies, stamps, etc., has acquired property, 85 x 100 ft., heretofore held by Hilbert Machine Co., and will remodel for new plant. Adjoining site has been secured for an addition.

National Cash Register Co., Dayton, Ohio, has taken bids on general contract for addition to plant No. 2, to cost about \$30,000.

Union Gas & Electric Co., Fourth and Plum Streets, Cincinnati, is having plans drawn for a new steam power plant, to cost about \$1,500,000, with equipment, pipe lines, etc. Columbia Engineering & Management Corporation, 61 Broadway, New York, is engineer.

Sparta Spoke Works, Sparta, Tenn., has begun work on new one-story plant, to cost about \$45,000 with machinery.

Mengel Co., Louisville, operating Mengel Body Co., manufacturer of automobile bodies, has arranged for new stock issue to total about \$2,000,000, a portion of fund to be used for expansion at Louisville and branch mill at Baton Rouge, La.

Officials of Mead Pulp & Paper Co., Chillicothe, Ohio, have organized a new subsidiary, to be known as Harriman Co., to construct new paper mill at Harriman, Tenn., to cost over \$800,000 with machinery. Mead Fiber Co., Kingsport, Tenn., another subsidiary, has work under way on expansion program to cost more than \$150,000.

Memphis Natural Gas Co., Memphis, Tenn., is disposing of a stock issue to total about \$1,000,000, part of fund to be used for pipe line construction and other work. Company is building 210 mile line from Monroe, La., gas fields to Nashville and vicinity.

Board of Education, Middletown, Ohio, is said to be planning installation of manual training equipment in new junior

high school, to cost about \$400,000, for which bids are being asked on general contract until Dec. 18.

Board of Trustees, Wilberforce University, Wilberforce, Ohio, is asking bids until Dec. 27 for power plant, 50 x 85 ft., to cost about \$100,000 with equipment. H. B. Briggs, Ohio-Hartman Building, Columbus, is architect.

McCarthy-Jones & Allen Co., Inc., 111 First Avenue, South, Nashville, Tenn., has been appointed distributor for the Botfield Refractories Co., Philadelphia.

Chicago

CHICAGO, Dec. 10.—Further recession in machine tool buying is noted, but the tone of the market is still encouraging in view of the fact that business in the last month of the year is usually far below the present volume. So far in December purchases are well ahead of a year ago for the corresponding period. Inquiry is active, but from an ever widening circle of miscellaneous users.

A local specialty manufacturer has ordered six presses and a general machine shop has purchased three radial drills and two lathes. A maker of builders' hardware has bought a 14-in. x 6-ft. cone-head lathe. List for Buda Co. and Whiting Corporation, both of Harvey, Ill., are active and Allis-Chalmers Mfg. Co., and International Harvester Co., continue to buy equipment. Prices for good second-hand machine tools are higher and the supply is inadequate for current demand.

Illinois Tool Works, 2501 Keeler Avenue, Chicago, will build an addition, 120 x 120 ft. to cost \$40,000. P. Jenkins, 400 North Michigan Avenue, is architect.

Mount Vernon Furnace & Mfg. Co., Second and Watson Streets, Mount Vernon, Ill., has awarded general contract to W. N. Atkinson, 114 North Johnson Street, for one-story addition, largely for enameling, to cost about \$50,000.

Fox River Valley Boat Co., McHenry, Ill., J. J. Rothermel, manager, has approved plans for new two-story boat-building and repair works, 50 x 65 ft., to cost about \$30,000 with equipment.

Sprague Iron Works, 4400 Addison Street, Chicago, has asked bids on general contract for a one-story addition, to cost more than \$35,000 with equipment. E. G. Johnson is company engineer in charge.

Common Council, Coggan, Iowa, has authorized installation of a municipal electric light and power plant, including 600-hp. Diesel engine unit and auxiliary equipment.

Board of Education, Virginia, Minn., plans installation of manual training equipment in new junior high school to cost \$500,000, for which bids have been asked on revised plans. J. A. Coddling, First National Bank Building, is architect.

Greenlee Brothers, Inc., Twelfth Street, Rockford, Ill., manufacturer of wood-working machinery, saws, etc., has awarded general contract to John M. Anderson, 1235 Jackson Street, for one-story foundry addition, 120 x 350 ft., to cost over \$75,000 with equipment.

City Ice & Fuel Co., Cleveland, has merged with Continental Ice Co., 33 South Clark Street, Chicago, with plants in Illinois, Iowa, Michigan and other states. Work has been started on additions to plants of Continental company at Oakwood and Port Huron, Mich., to include installation of new machinery.

South Atlantic

BALTIMORE, Dec. 10.—Bids will soon be asked by Joseph E. Sperry, Calvert Building, Baltimore, architect, for six-story automobile service, repair and garage building, to cost \$500,000 with equipment.

Draper Corporation, Hopedale, Mass., manufacturer of cotton mill machinery, will soon take bids for two-story branch mill, 100 x 265 ft., at Spartanburg, N. C., to cost over \$65,000 with equipment. J. E. Sirrine & Co., Greenville, S. C., are architects and engineers.

B. F. Goodrich Co., Akron, Ohio, manufacturer of automobile tires and other rubber goods, has purchased Martha Mills, Thomaston, Ga., for branch plant. Plans are under way to treble capacity, to cost more than \$2,000,000 with machinery. T. G. Graham is vice-president in charge.

Atlantic Refining Co., 260 South Broad Street, Philadelphia, is considering extensions and improvements in branch oil refinery at Brunswick, Ga., to cost more than \$350,000 with equipment.

Commercial Mfg. Co., Athens, Ga., recently organized by T. M. Tillman, Athens, and associates, plans early operation of local factory to manufacture store fixtures, show cases and kindred products.

Board of Directors, McDonough School for Boys, Pikeville, Md., has authorized rebuilding of school, recently destroyed by fire, to cost more than \$400,000. Manual training department is planned. William H. Emery, 18 East Lexington Street, Baltimore, is architect.

L. E. Martin, president, Dominion Land & Development Corporation, Times-Despatch Building, Richmond, Va., is at head of project to establish and operate new plant for production of wood alcohol and wood-chemical products. Inquiries are being made for equipment.

King Hardware Co., Atlanta, Ga., will soon begin construction of a new storage and distributing plant at Buckhead, to cost over \$50,000 with equipment. Work will be carried out in name of King Holding Co., an affiliated organization. A. Ten Eyck Brown, Atlanta, is architect.

Shenandoah Valley Canning Corporation, Harrisonburg, Va., is planning enlargements and installation of additional machinery. It is also contemplating new branch plant for vegetable canning, to cost about \$50,000 with equipment. C. E. Dovel is general production manager.

Buffalo

BUFFALO, Dec. 10.—Michael Hayman & Co., 856 East Ferry Street, Buffalo, metal products, have awarded general contract to H. F. Stimm, Inc., Elliott Square, for one-story foundry addition, to cost about \$25,000 with equipment. N. H. Study, Prudential Building, is engineer.

C. M. Keys, head of Curtiss Aeroplane & Motor Co., 74 Kail Street, Buffalo, and associates, have organized North American Aviation, Inc., with capital of 2,000,000 shares of stock, to operate aircraft properties, including purchasing of interest in going airplane and airplane motor companies. New organization has arranged for sale of stock to total \$30,000,000, part of fund to be used for initial operations. Mr. Keys is head of new company.

Sprague-Sells Corporation, 523 Cornwall Avenue, Buffalo, manufacturer of canning

and other machinery, has merged with John Bean Mfg. Co., San Jose, Cal., manufacturer of kindred equipment, agricultural machinery, etc., under last-noted name. In addition to Buffalo plant, Sprague-Sells Corporation has branch factories at Hoopeston, Ill., and Hayward, Cal. Expansion is planned. John D. Crummey is head of John Bean company.

Universal Wireless Communication Co., care of G. Morton Wolfe, 1377 Main Street, Buffalo, architect and engineer, has plans for new radio station at Scobeyville, N. J., to cost about \$100,000 with power equipment. Company also plans construction of series of such stations in different parts of country, with second plant now projected at Philadelphia, to cost about \$125,000.

Michel Presutti, 1152 La Salle Avenue, Niagara Falls, N. Y., and associates, have organized La Predow Construction Co., to operate local plant to build and repair barges, trucks, etc.

Plant and equipment of former Standard Turbine Corporation, Scio, N. Y., will be sold at public auction Dec. 20 by Industrial Plants Corporation, New York. Equipment includes lathes, shapers, planers, milling machines, drills, cranes, boring mills, turbines, generators, etc.

Emil Steinhorst & Sons, Inc., Utica, N. Y., maker of sheet metal products, has arranged for purchase of Kendall mill property for expansion.

Gulf States

BIRMINGHAM, Dec. 10.—Plans are under way by American Cast Iron Pipe Co., Birmingham, for one-story addition to foundry, reported to cost over \$45,000 with equipment.

Lufkin Ice Co., Lufkin, Tex., has plans for a one-story addition to cost about \$100,000 with machinery.

Board of Education, San Antonio, Tex., is considering installation of manual training equipment in new two-story junior high school to cost \$125,000. Morris & Noonan, Builders' Exchange Building, are architects.

Firestone Tire & Rubber Co., Akron, Ohio, is completing plans for new factory branch and distributing plant at Jacksonville, Fla., to cost about \$300,000 with equipment. Mark & Sheftall, Jacksonville, are architects. Company is also having plans drawn for a branch at Fort Lauderdale, Fla., to cost about \$35,000. H. S. Harvey, Guaranty Building, West Palm Beach, Fla., is architect for latter building.

State Building Commission, New Capitol Building, Jackson, Miss., is having plans drawn for new power plant at Alcorn Agricultural and Mechanical College, Alcorn, to cost about \$40,000 with equipment. Bids to be taken in January. Claude H. Lindsley, Lamar Life Building, Jackson, is architect.

Texas Corporation, Houston, Tex., has authorized construction of new oil refinery on 75-acre tract at El Paso, Tex., to cost over \$650,000 with equipment. Storage and distributing facilities will be provided.

Board of Works, Jacksonville, Fla., has begun construction of municipal repair and equipment shops, including two one-story units, to cost about \$55,000. One building will be equipped as machine shop.

Central Power & Light Co., San Antonio, Tex., is planning an expansion and improvement program during 1929 to cost

about \$5,000,000, including additions in generating facilities, transmission lines, power substations and other extensions.

City Council, Fort Worth, Tex., has authorized appropriation of \$30,000 for extensions in municipal airport, including new hangar, 80 x 160 ft., with repair facilities, for which bids will soon be asked. W. G. Fuller is manager of airport.

United Public Service Co., 100 West Monroe Street, Chicago, has purchased plant of Texas Ice & Refrigerating Co., Fort Worth, Tex. Plans are under way for extensions and improvements, including construction of new refrigerating unit, to cost about \$80,000 with equipment.

Automatic bottling machinery, mechanical conveying, packing and handling equipment will be installed in new two-story factory of Houston Coca Cola Bottling Co., 1210 Washington Street, Houston, Tex., 110 x 120 ft., to cost about \$70,000. Company will also erect one-story automobile service, repair and garage building for motor trucks, 50 x 93 ft., on adjoining site. Alfred C. Finn, Bankers' Mortgage Building, is architect.

Pan-American Transport Co., Jacksonville, Fla., has plans for one-story automobile service, repair and garage building, to cost about \$100,000 with equipment. C. B. Schoeppl, Theater Building, is architect.

Bain Beaird Co., Inc., Shreveport, La., has changed name to Beaird Corporation and removed offices from Texas and Reynolds Streets to plant on Atkins Avenue. New office building, machine shop and oxygen plant are being erected and machinery is being installed to double capacity of oxygen department. Company manufactures oxygen and acetylene gas, operates machine shop and engages in car repairing and structural steel work. J. B. Beaird is vice-president and general manager.

St. Louis

ST. LOUIS, Dec. 10.—Revised plans are being drawn by Swift & Co., Union Stock Yards, Chicago, for extensions and improvements in branch plant at South Vandeventer and Papin Streets, to cost about \$500,000 with equipment.

A. & B. Spring Co., 719 West Main Street, Oklahoma City, Okla., manufacturer of steel springs, etc., is considering one-story plant unit, 75 x 140 ft., to cost more than \$50,000 with equipment.

Missouri Pacific Railroad Co., Missouri-Pacific Building, St. Louis, has approved plans for power plant at Wichita, Kan., to cost about \$40,000 with equipment. E. A. Hadley is chief engineer.

Arkansas Cold Storage Co., Little Rock, Ark., will soon take bids for two-story cold storage and refrigerating plant, to cost over \$150,000 with machinery.

White Oak Refining Co., Tulsa, Okla., has work under way on extensions and improvements in gasoline refinery at Allen, Okla., including installation of additional equipment, to cost more than \$100,000.

Gasconade River Power Co., 1015 Baltimore Avenue, Kansas City, Mo., is planning construction of hydroelectric power plant on Gasconade River in Phelps County, to cost about \$250,000 with transmission line.

American Eagle Aircraft Corporation, 2800 East Thirtieth Street, Kansas City, Mo., has awarded general contract to W. K. Martin, Dwight Building, for new plant in Fairfax industrial district, con-

sisting of one- and two-story buildings, 100 x 300 ft., and 30 x 70 ft., to cost more than \$80,000 with machinery. Chester E. Dean, Reliance Building, is architect.

Commonwealth Utilities Corporation, Oklahoma City, Okla., operating electric light, power and ice properties in several States, is disposing of bond issue of \$2,500,000, part of proceeds to be used for extensions and improvements.

Coffman Aircraft Co., Oklahoma City, Okla., has acquired local plant of Midland Motor Car Co. for manufacture of monoplanes. Company has also secured property of Southwest Airways Co., including flying field, and will build hangar, repair shop and other units. D. J. Marshall is president.

Barnsdall Refineries, Inc., Barnsdall, Okla., has broken ground for one-story repair shop to cost about \$35,000 with equipment.

Milwaukee

MILWAUKEE, Dec. 10.—Machine tool business in the first week of December was on about the same level as that in November. Inquiry also was well maintained. Indications point to a relatively large amount of business in the immediate future. Meanwhile most tool builders are fully occupied and to complete the orders on the books of some will require 60 days or longer. The Dec. 1 labor report again shows a substantial gain in foundries and machine shops.

Minneapolis, St. Paul & Sault Ste. Marie Railway Co., Fifth and Marquette Avenues, Minneapolis, has placed contracts for new work at its division headquarters at Ashland, Wis., to cost \$400,000. Fairbanks, Morse & Co., 900 South Wabash Avenue, Chicago, have been awarded contract for a new coaling shed and cinder pit, 100 ft. high. General contract for a new roundhouse, 102 x 125 ft.; a boiler house and an oil house, has been placed with Frank Tomlinson, Prentice Avenue, Ashland.

Aluminum Goods Mfg. Co., Manitowoc, Wis., which has broken ground for a seven-story addition, 115 x 302 ft., to its main plant, is having plans drawn by Lockwood, Greene & Co., consulting engineers, Chicago, for an extension of its branch works at Two Rivers, Wis., to cost \$450,000.

Board of Vocational Education, Waukesha, Wis., has purchased a site on Maple Avenue for vocational training school to be built early in 1929 at a cost of \$75,000 for first unit. An architect will be selected at once. H. L. Horning, president Waukesha Motor Co., is chairman of board.

Nash Sales, Inc., Broadway and East Wells Streets, Milwaukee, will build a five-story service and storage addition, 30 x 120 ft., to its present five-story headquarters building, 120 ft. sq., according to plans by M. Tullgren & Sons Co., architect, 20 Prospect Avenue. Investment will be about \$80,000. Rudolf Hokanson is president.

Common Council of Racine, Wis., has engaged Alvord, Burdick & Howson, consulting engineers, Chicago, to draft plans and supervise construction of new sewage disposal plant to cost \$2,500,000. Contracts will be let about Feb. 1. The project calls for extensive pumping and engine equipment, pipe, etc. Charles Beaugrand is city engineer.

Hoffmann & Billings Mfg. Co., 100 Second Street, Milwaukee, manufacturer of plumbers' and steamfitters' materials and supplies, has disposed of its jobbing business to Crane Co., Chicago, but states that it will continue manufacturing in its plant at 220 Becher Street.

Wisconsin Screw Co., Racine, Wis., maker of screw machine products, has removed its plant to larger quarters and will be in market for additional equipment.

Indiana

INDIANAPOLIS, Dec. 10.—DeLuxe Tire Co., Fort Wayne, has plans for one-story plant at Clay and Wayne Streets, 60 x 145 ft., to cost about \$50,000 with equipment.

Northern Indiana Public Service Co., 112 East Wayne Street, Fort Wayne, has awarded general contract to Henry Wehrenberg & Son, 618 South Calhoun Street, for a one-story machine shop.

Marmon Motor Car Co., 1039 North Meridian Street, Indianapolis, is arranging for a new stock issue of 60,000 shares, to net about \$3,000,000, a considerable part of fund to be used for expansion in production.

Chrysler Motor Corporation, Detroit, has awarded contract to Kanzler & Son, Furniture Building, Evansville, for one-story addition to motor truck plant at Evansville, to cost about \$250,000 with equipment. Thol & Legeman, American Trust Building, Evansville, are architects.

International Harvester Co., 606 South Michigan Avenue, Chicago, has awarded general contract to Henry Hedde, 309 Seventh Street, Logansport, for factory branch and distributing plant for motor truck division at Logansport, to cost about \$55,000.

American Steel Foundries, 410 North Michigan Avenue, Chicago, has awarded general contract to Sumner-Sollitt Co., 307 North Michigan Avenue, for one-story addition at East Chicago, Ind., 75 x 100 ft., to cost about \$50,000 with equipment.

Claude S. Gordon Co., Chicago, high temperature industrial engineer, on Jan. 1 will remove its Indianapolis office to 505 Merchants Bank Building.

Pacific Coast

SAN FRANCISCO, Dec. 5.—Crané Co., 836 South Michigan Avenue, Chicago, has acquired tract of 10 acres at Los Angeles, and will have plans drawn for new plant for Pacific Coast trade, to cost more than \$500,000 with equipment.

Shell Oil Co., 200 Bush Street, San Francisco, has approved plans for two-story storage and distributing plant at Oakland, Cal., to cost about \$200,000 with equipment. Engineering department of company is in charge.

Douglas Aircraft Co., Inc., recently organized, has taken over Davis-Douglas Co., Santa Monica, Cal., manufacturer of military airplanes. New company plans expansion in facilities, with installation of equipment for production of commercial aircraft, including parts and assembling facilities. Arrangements have been made for issue of 300,000 shares of stock.

Tacoma Utilities Department, Electric Light Division, Tacoma, Wash., J. L. Stannard, chief engineer, has authorized extensions in Cushman municipal hydro-electric power project, providing for about 30,000 hp. additional capacity, and will soon ask bids. New unit will cost about \$2,000,000 with transmission lines.

City Council, Long Beach, Cal., H. S. Callahan, city manager, is considering construction of three-story municipal service, repair and garage building, to cost about \$225,000 with equipment.

Lockheed Aircraft Corporation, Burbank, Cal., is arranging an expansion program at local plant and branch factory at Chicago, to include new buildings and installation of machinery. Company is planning an increase in capital from 25,000 to 150,000 shares of stock.

Wickwire Spencer Steel Co., Inc., New York, will erect warehouse at Portland, Ore., for Pacific Northwest trade, formerly handled through dealers. Building is expected to be ready for occupancy in February. W. J. Coleman is manager of branch.

Oregon Welding & Machine Works, formerly at Fifth and Glisan Streets, Portland, Ore., has moved to larger quarters at Park and Everett Streets, formerly occupied by Eureka Carriage & Auto Works. Company has purchased equipment of Eureka organization and will enlarge field of operations.

Canada

TORONTO, Dec. 10.—Replacement purchases have stimulated machine tool sales the past week or two. A strong diversified demand has developed and several small lists for half a dozen tools have been issued. Manufacturers of railroad rolling stock have made extensive purchases lately and some good orders also have been placed by automobile manufacturers, garages and repair plants.

Mundet Cork & Insulation Co., Ltd., 51 St. Lawrence Avenue, Toronto, has purchased site at corner of Booth Avenue and Keating Street for erection of a plant to cost \$100,000.

Smith Brothers, 183 Duke Street, Toronto, manufacturers of truck and motor car bodies, have purchased a site at Logan Avenue and Keating Street and will erect a plant to cost \$150,000.

Yardley & Co., Ltd., 358 Adelaide Street West, Toronto, manufacturer of soap, etc., has purchased a site, 100 x 233 ft., at York and Fleet Streets, Toronto, and will erect a five-story factory and warehouse to cost \$200,000. General contract for construction has been awarded to De Jonckheere Construction Co., Toronto.

J. J. McSweeney, president Equitable Securities Corporation, Ltd., Montreal and Toronto, has purchased for himself and associates MacKinnon Steel Co., Sherbrooke, Que., one of Canada's leading structural steel companies, which has been owned and operated as a family concern for 20 years. It is understood that plans are under way for additions to works and equipment. Associated with Mr. McSweeney are: D. H. McDougall, director McIntyre Porcupine Mines, Ltd.; Walter G. Mitchell; J. B. Woodyatt, president Southern Canada Power Co.; John Irwin, president McColl-Frontenac Oil Co.; J. T. McCall, president Drummond, McCall & Co., Ltd.; and George D. MacKinnon, president Rutherford Lumber Co., Ltd.

Dominion Road Machinery Co., Ltd., Goderich, Ont., has started work on an addition to increase manufacturing facilities 75 per cent.

Queen City Dental Manufacturers, Ltd., 112½ Carlton Street, Toronto, contemplate erection of a new plant.

Canada Metal Co., Ltd., 29 Fraser

Avenue, Toronto, has purchased a site on Fraser Avenue, 220 x 266 ft., and will erect an addition.

McColl-Frontenac Oil Co., Ltd., 114 Don Esplanade, Toronto, has purchased Bladwin Steel premises on Ashbridges Bay, Toronto, and will remodel building in spring for a refinery.

Corrugated Paper Box Co., Ltd., 189 Geary Avenue, Toronto, has awarded contract for excavations and foundations for its plant at Leaside, Ont., to John Gunn & Sons, Winnipeg. Building will be one story and basement, 180 x 700 ft. G. C. Treloar, 11 Leader Lane, Toronto, is engineer.

Electrolier Mfg. Co., 5849 Boyer Street, Montreal, has awarded contract to E. Barabe, 1442 St. Dominique Street, for a two-story factory, 70 x 94 ft., to cost \$15,000.

Foreign

PLANs are being arranged under direction of Soviet Russian Government, Moscow, for extensions and improvements in iron works and smelting plant at Makeevsk to increase capacity 19 per cent. Existing works have annual output of 250,000 metric tons pig iron, 220,000 metric tons of steel, and 179,000 metric tons of rolled steel. Information regarding project at office of American-Russian Chamber of Commerce, 143 West Fifty-seventh Street, New York.

Dortmund Municipal Utilities, operated by City of Dortmund, Germany, comprising three separate interests, Dortmund Gas Co., Dortmund Water Works and Dortmund Street Railways Co., are disposing of bond issue of \$3,000,000 in United States, large part of proceeds to be used for extensions and additional equipment.

German General Electric Co., Berlin, Germany, has secured concession from Government of Mexico for construction and operation of high power radio station near Mexico City, including steel towers; power plant, machine shop and other units to cost about \$650,000.

Sinclair Consolidated Oil Corporation, 45 Nassau Street, New York, has purchased controlling interest in Venezuelan Petroleum Co., 55 Liberty Street, and will merge its oil properties in Panama, Colombia and Venezuela with those of acquired company, which will be continued as a subsidiary. Plans are being made for increase in capital of Venezuelan company from \$5,000,000 to \$10,000,000, part of proceeds to be used for development of oil properties, installation of equipment, storage and distributing facilities.

A company at Helsingfors, Finland, is arranging with municipality for guarantee of loan of \$1,000,000, fund to be used for construction of new warehouses and installation of elevating, conveying and other loading equipment. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Finland No. 293054.

Soviet Russian Government, Moscow, has approved plans for construction of Bogomolovsk copper smelting plant near Tagil. Information at office of American-Russian Chamber of Commerce, 143 West Fifty-seventh Street, New York.

Ford Motor Co., Detroit, is planning construction of plant in Brazil to manufacture automobile tires, to be operated in conjunction with rubber plantations now being developed. A site will be selected, it is said, in vicinity of Para, near plantation base, entire project to cost more than \$600,000.

THE IRON AGE

New York, December 20, 1928

ESTABLISHED 1855

VOL. 122, No. 25

Has Tin Plate a New Competitor?

BY DR. C. L. MANTELL*

ALUMINUM producers, particularly on the European Continent, are actively looking for new markets and possible uses for their metal. Recent development work has been along the lines of substitution, for tin plate used in the canning industries, of aluminum as aluminum-coated steel plates.

About 40 per cent of the world's production of tin goes into tin plate, and of this from 60 to 75 per cent is used for food containers or tin cans. In the United States efforts have been made to reduce the amount of tin used in plating, and at present this is about 34.94 lb. per ton of tin plate, against 38.83 lb. used in 1922. In England and on the Continent, the quantity of tin used per ton of tin plate is somewhat more than 34.94 lb.

The employment of aluminum plate as a substitute for tin plate was the subject of research in Germany during the war, but no success was obtained, due to the fact that the quality of the aluminum of that time was much inferior to that of the virgin aluminum manufactured today. It was discovered that aluminum, to replace tin plate for food containers, must possess particularly high mechanical and chemical properties.

The Aluminum Advisory Bureau in Berlin caused this question to be further investigated. The influence of aluminum of 99 to 99.5 per cent purity on preserved food of different kinds, and the influence of these foods on the aluminum, were tested, with the result that drawn aluminum plate of the above degree of purity was found to be well suited for food containers and, compared with tinned plate, was very slightly attacked by the foodstuffs. Vegetables, fruit, and other materials were not found to depreciate in aluminum containers.

Germans Planning to Erect Plants

In recent months, at periodic intervals, reports have been circulated of German plans to make aluminum-coated sheets to compete with, and perhaps eventually replace, tin plate. The Aluminum Research Institute in Germany has devoted some attention to the application of aluminum sheets according to the patents of a German engineer by the name of Serger. These reports have aroused considerable interest among tin plate manufacturers.

The Eisen & Stahlwerk Hoesch at Dortmund has completed a program of development toward working out the kinks in rolling aluminum on steel. Krupps and Stockheide are reported to be building a large sheet rolling mill in

Aluminum-Coated Sheets Advocated in Germany, But Some Question of Their Early Achieving Popularity—How the Aluminum Is Put On

which aluminum-plated steel sheets will be turned out at the rate of about 100,000 tons annually. It is interesting to note that the Eisen & Stahlwerk Hoesch is reputed to be building a works for the production of these Feran Bleche with a capacity of 30 tons per hour, which would be an annual production of 220,000 tons. This is twice as much as the

whole of the German tin sheet production.

The aluminum and the steel sheets are sweated together. In commercial operation, aluminum-coated hoop steel has been a commercial article for a considerable time. It is claimed that these aluminum-coated sheets are 11 per cent lighter than tin sheets, and that they have better corrosion resistance. The latter part of this statement must be taken with a large grain of salt, in view of the extensive and satisfactory application of tin plate in its multiplicity of uses, and the well-known tarnishing of aluminum with the formation of a protective oxide coating as a result of atmospheric conditions.

Aluminum-Coated Sheets Light

Considered on a theoretical basis, assuming tin plate to contain approximately 1.6 to 1.8 lb. of tin per base box, and in view of the fact that aluminum is a much lighter metal than tin, the same weight coating of aluminum should allow a coating three times as thick. With tin at approximately 48c. and aluminum at 24c., the coating on a metal basis only should cost but half as much.

Any reasoning from this basis is fallacious and conclusions illusory. The cost of tin in place of tin plate is very little more than the metal cost, inasmuch as the tin needs undergo no fabrication. The same, however, does not hold true for aluminum in its application on steel sheets, for the coating must bear the fabrication cost of putting the aluminum metal into such shape that it can be sweated on, or rolled with, steel plate. There is practically no manufacturing data as yet of an authoritative nature which will allow a comparison of costs between aluminum-coated sheet and tin plate.

Technology of the Coating Process

Sheet steel, coated with aluminum by a mechanical sweating or welding method, has been produced previously. The aluminum layer is always relatively thick. Material of this kind has shown high resistance to accelerated corrosion tests. It is to be noted, however, that aluminum and iron alloy rapidly. It would seem then that the fundamental conditions for successful coating by hot dipping were ful-

*Consulting chemical engineer, Pratt Institute, Brooklyn, N. Y.

filled. Iron and aluminum are completely miscible in the liquid state. In the aluminum rich mixtures, the iron precipitates from the solution upon solidification as the compound FeAl_3 , containing 41 per cent iron. This compound forms only very slightly below the melting point of aluminum.

Success in hot dipping of iron and aluminum is attained with difficulty and only after special preparation of the surface of the iron. Much of the difficulty is to be attributed to the tightly adhering film of aluminum oxide, which forms very rapidly, as well as to the occurrence of a large amount of iron-aluminum compounds. When iron is coated with aluminum, either by hot dipping or by mechanical rolling methods, there is a rapid alloying action occurring between the two metals. This usually results in a very brittle layer adjacent to the steel or iron base. The uses to which such material could be put would be limited to those which did not involve bending or any other form of severe deformation.

From the relative positions of aluminum and iron in the electrochemical series, it might be concluded that aluminum would be a more desirable coating metal for the protection of iron and steel than tin, inasmuch as aluminum would be anodic in its reaction to iron. The behavior of coatings in service, however, does not fully support such a conclusion. The protective oxide film, which readily forms on a fresh surface of aluminum on exposure to the atmosphere, entirely masks the anodic behavior of an aluminum coating toward iron. The coating then becomes essentially neutral in its electrochemical reaction toward iron.

Tin and Aluminum Coatings Compared

In a number of its applications, tin plate is used for decorative purposes, and the tin coating on iron markedly improves its external appearance. It is very doubtful whether aluminum-coated sheets can be made in the near future on a commercial basis so that they will have the pleasing appearance of silvery white tin plate. The tech-

nology of tin plate manufacture is exceedingly well developed. In contrast, the manufacture of aluminum-coated sheets has practically no technology.

In one of its major applications, that of tin cans, tin plate has been found to be an all-round satisfactory container for almost all foods. Modifications, such as enameled plate, have been developed to adapt the material specifically to the preservation of certain foods in the best possible manner. The toxicology of tin and tin salts has been widely studied. Cases of tin poisoning are almost unknown. In contrast, there is considerable dispute as to the toxicology of aluminum and its salts.

It is yet to be shown on a commercial basis that aluminum-coated sheets can be produced so that the coating of the aluminum on the iron is free from pinholes and perforations, or at least equal to the quality, as far as uniformity of covering is concerned, of good grade tin plate.

Little Cause for Worry for Tin Plate Makers

At the present moment there is very little cause for worry on the part of the tin plate maker in reference to this development. Tin plate and tin cans are exceedingly well established. Aluminum-coated sheets may become important in the future, but at the present time the application is still largely in its development stages.

Many substitutes for tin plate have been tried out, but in practically every case it has been proved beyond question that the tin can makes the best hermetically sealed package for the preservation of all kinds of food. True enough, in a number of cases the tin can has been modified to make it more satisfactory for certain foods, and even now it is unsatisfactory for foods like cider, cranberries, apple butter, apples, rhubarb, and some berries.

As the country develops and the population grows, the demand for tin plate would be expected to increase. Such has been the case, and the manufacturers of tin plate see a boom nearly every year on account of the very large and growing demand.

Chrome-Tungsten Steel Excellent at High Temperatures

CONTINUING their work on boiler materials, Prof. A. E. White and C. L. Clark, Department of Engineering Research, University of Michigan, now report on the "Effect of Alloying Elements upon the Stability of Steel at Elevated Temperatures." A standardized short time tensile test was used to enable them to explore a number of promising alloys at 1000 deg. Fahr. and above. Confirmatory long-time creep tests were made on those giving best results in the preliminary investigation.

From the large mass of data secured, the authors se-

are, however, much more expensive. On this same basis, several high-alloy steels in the annealed condition showed good but not unusual properties. (See Table I.)

The last mentioned steel seemed to show such marked superiority that tensile tests were made at 1000 deg. Fahr. after various heat treatments. A proportional limit of 100,000 lb. per sq. in. was secured with little ductility, but other treatments gave 50,000 lb. with elongations of 17 per cent. (See Table II.)

Such a steel is not easy to machine or otherwise fabricate, but Messrs. White and Clark believe it to be very

Quenched 2250, Drawn 1200	100,000	125,000	2.0	3.9

lected the proportional limit at 1000 deg. Fahr. as the best index of merit. On this basis a 2 per cent and a 5 per cent nickel steel gave little better figures than a plain carbon steel. Low-manganese steels have already been shown to be superior to either carbon or low-nickel steels, although the present investigators are unable to secure proportional limits at 1000 deg. Fahr. within 20,000 lb. per sq. in. of those reported by Krivobok and his associates to the Mining Engineers in 1927. Low chrome-nickel steels are classed in the same category as the low-manganese steel as far as proportional limit at 1000 deg. Fahr. is concerned; they

promising for high-temperature, high-pressure work. A sample normalized at 1700 deg. Fahr. was loaded at 35,000 lb. per sq. in. while heated constantly at 1000 deg. Fahr. The extension gradually increased to about 0.0023 in. per

Grain Size Controls Toughness

McQuaid-Ehn Test Necessary to Distinguish Between Heats of Steel with Same Chemical Analysis Yet Responding Differently in Mass Production

BY THOMAS W. HARDY*

IN the thirty years which have elapsed since Kjellin, Stassano and Heroult gave the steel maker the electric melting furnaces, the electrical engineer has come to realize that electrical considerations must be subordinated to metallurgical, and the metallurgist has learned that the process is not a simple cure-all. With the elimination of the early misconceptions, the art and practice of steel making has had a phenomenal development and electric steels are finding wider and wider application.

Still there are limitations. As long as pig iron is converted into steel, it is doubtful if the electric furnace can ever displace the Bessemer converter and the open-hearth furnace for common steels, since the first mentioned is neither an efficient nor an economical apparatus in which to carry out the strongly oxidizing reactions necessary.

Yet for producing light and medium weight castings, the acid electric furnace has displaced the crucible and is making inroads on the small Bessemer converter. The chief reason is economic; but it is also true the product is sounder, more uniform and generally of higher quality than converter castings.

For tool steels the story is much the same. In the United States almost entirely, and in Europe to a large extent, the old crucible process has been supplanted by the basic electric process; the steel is equal in quality to the best crucible steel and the cost is considerably less.

It is in the production of engineering steels that electricity seems destined to play the dominant part. Engineering steels include simple and alloy steels for automobiles, aircraft, locomotives and similar machines requiring high quality and reliability. Rapid expansion for such purposes may be ascribed to two main causes; first, higher specialization by the automotive and other industries; and, second, a smaller price differential between open-hearth and electric steels from large tonnage, high-powered furnaces. Perhaps it would be better to state that the large tonnage, high-powered electric furnace has been developed to meet the demand for a reasonably priced high-grade steel made

to closer chemical limits and more uniform physical characteristics.

Close Chemical Control in the Basic Electric Process

Until recent years the necessity for close chemical control was not urgent. The steels in common use were made

to specifications permitting a carbon range of 10 points and correspondingly wide ranges for other elements. Furthermore, the Society of Automotive Engineers' specifications were so framed that, should the melter miss the carbon range he was aiming at, the heat would still be within some other specification and would therefore be marketable.

Recently, large customers have begun to specify 5-point carbon ranges, and also to narrow and change the conventional ranges of alloying elements to suit their own ideas. In addition, special purpose steels are bought sometimes containing three or more alloying elements to close limits, compositions that are so different from any S.A.E. alloy as to make them unsaleable should the heats be "off" chemically. Close chemical control has thus become an absolute necessity.

Fortunately the basic electric process permits such close control. The reasons are fundamental. With the older processes, the molten metal is in contact with a more or less oxidizing slag which is constantly removing oxidizable constituents such as carbon, manganese and chromium. In the basic electric process, however, the slag is not merely non-oxidizing, but is actually reducing in character, so that oxidizable elements may be held in the bath without loss until the chemical laboratory has made an exact analysis. Additions may then be made on a mathematical basis and the chemical composition of the finished steel controlled with exactitude.

As an illustration see the accompanying graph of the composition of a series of high-chromium heats. These were made consecutively in three different furnaces by routine methods and the graphs include every heat made during that particular campaign.

But a specified chemical composition does not insure definite physical characteristics. It is well known that

heats of steel of practically the same analysis do not always respond similarly to forging and machining, nor will they always develop the mechanical properties that might reasonably be expected. Such conditions have led some users to specify, in addition to chemical composition, that the steel must be capable of developing certain minimum physical properties when subjected to certain mechanical and thermal treatments. The reason for this double requirement is that special treatment has to be devised for "off" heats; in many instances heats are returned to the maker as hopeless. Automatic machine tools and continuous annealing and heat treating equipment are not flexible enough to admit of more than minor adjustment to take care of variables in machining quality and response to heat treatment, even if it were known just what changes would produce the desired results.

Probable the most valuable outcome of the McQuaid-Ehn test is the attention it has drawn to the physical characteristics of steel as distinguished from its chemical composition. Originally devised to distinguish between heats of steel that would respond normally to routine case hardening operations and heats that would not, the test is probably more often used as a means of predicting the manner in which a heat of steel will respond to subsequent annealing, machining and heat treating operations.

It is well known that different heats of steel of the same chemical analysis will develop widely differing grain sizes when carburized under standard conditions. The latter op-

eration consists of packing the sample in a highly energized carburizer, heating to 1700 deg. Fahr., holding at this temperature for eight hours, and cooling the pot and its contents in still air. A steel sample thus treated, after suitable polishing and etching, will exhibit in the case a structure consisting of pearlitic grains, the boundaries of which are made sharp and distinct by the network of excess cementite. Grain-size charts are used, showing photomicrographs at 100 diameters of steels that have developed different but fairly definite grain sizes in this carburizing test, and the unknown sample is classified as, say a No. 5 or a No. 8, according to its similarity to one or other of the photomicrographs on this chart.

This McQuaid-Ehn carburizing test is being applied not only to carburizing steel but also to medium and high carbon, simple, and alloy steels, and experience has shown that the physical characteristics are considerably different in a steel that develops a coarse grain in the carburizing test and in a chemically similar one that develops a fine grain. This difference is so great that it sometimes accounts for the difference between success and failure in mass production.

Three of the most important physical characteristics are hardenability, machinability and mechanical properties. That these are definitely influenced by the same conditions that determine whether the steel will be coarse or fine grained in the carburizing test will be seen from the following data, selected from a large number available, not be-

cause they show the extreme variables, but because they are the results of tests made under strictly comparable conditions.

Hardening Power of Fine Grained Versus Coarse Grained Steels

Many observations have led to the generalization that, other things being equal, steels that are coarse grained in the McQuaid-Ehn test harden more intensely and deeper than those that are fine grained. This difference in hardness is most pronounced in plain carbon and low alloy steels and becomes negligible in the higher alloys. The following data on 1-in. rounds illustrate these points:

In order to treat the fine grained steel and its companion coarse grained steel to the same Brinell hardness at the center of the bar, a considerably lower drawing temperature had to be used for the fine grained steel, because it has lower hardness after quenching.

Here it will be noted that the deep hardening action caused by molybdenum has been sufficient to overcome the effect of grain size on the hardenability of steel and the two steels respond exactly the same to a given heat treatment as far as Brinell hardness is concerned.

Machinability

The writer regrets that he is unable to present concrete figures to illustrate the superior machining quality of coarse grained steel. That this superiority exists cannot be doubted

in the face of actual production results independently obtained by several large users who worked steels of known grain size.

Mechanical Properties of Fine Grained Steels

Ready machinability, important though it may be to the man interested in rapid and economic production, is not the

Manganese-Molybdenum Steel 26 MMC at 100 Diameters. Left to right: As rolled Heat treated to 269 Brinell McQuaid-Ehn test

The results of a large number of tests on various types of steel show clearly that while the tensile properties of a given steel are practically independent of the grain size after the carburizing test, the dynamic strength as measured by the Izod impact test is decidedly greater in fine grained than in coarse grained steels.

To illustrate this characteristic difference in the steels already described when heat treated to the same Brinell hardness, the appended test results are submitted. Each pair of steels was made and tested under comparative conditions and the figures presented show general tendencies that have been confirmed with other types of steel. The fig-

ures given are the average of four tensile tests and 12 impact breaks from each heat.

A consideration of these data leads to several conclusions the more important of which may be summarized as follows:

1. Other things being equal, the resistance to shock, as measured by the Izod impact value of a steel that is fine grained in the carburizing test, is distinctly greater than that of a steel that is coarse grained.
2. This greater toughness of fine grained steels is also reflected to some extent in the figures for reduction in area.
3. The values for yield point, ultimate strength and elongation appear to be unaffected by the grain size in the carburizing test.
4. Other things being equal, the addition of molybdenum to a straight manganese steel, be it coarse grained or fine grained, results in greater impact strength.
5. The importance of grain size to the impact resistance of steel is clearly brought out by the fact that the fine grained manganese steels of both carbon contents developed approximately the same Izod values as the coarse grained manganese-molybdenum steels, indicating that as regards Izod value, the existence of a fine grain in the carburizing test is as important as the presence of 20 to 25 points of molybdenum. The combination of molybdenum and fine grain is, of course, still more desirable.

McQuaid-Ehn test

A property of fine grained steels which has not yet been mentioned is wide temperature range in heat treatment. Since they resist grain growth, such steels may be heated

considerably above the minimum temperature required for complete hardening without coarsening, with its attendant brittleness.

In practical heat treatment this point is of great importance. By virtue of it, "single treating" carburizing steels are made possible, in which a commercially satisfactory refinement of both case and core may be effected by a single heating and quenching operation. The single treatment possesses two advantages over "double treatment," namely, minimized distortion and lower cost by eliminating the first or core refining treatment.

In other than carburizing grades, fine grained steels are more "fool proof" in heat treatment—an equally advantageous characteristic. Such steels lack the extreme sensitivity that necessitates working within narrow limits of temperature and time. One may therefore safely adopt quenching temperatures well above the critical range, since errors due to non-uniformity of temperature in the furnace or minor errors in the pyrometer system will not be accompanied by overheated or underheated structures.

General Considerations

It has been pointed out that many of the important physical characteristics of steel, including machinability, hardenability and mechanical properties, are definitely affected by grain size in the McQuaid-Ehn test. It might reasonably be anticipated that these differences would be explained

Steel 40 MMF. Similar in chemical composition to 40 MMC above but responding differently to carburizing test

by difference in the microstructure in the "as rolled," and more particularly in the heat treated or "as tested" conditions. A study of the pictures, which show the microstructures in the "as rolled," "as tested" and "after McQuaid-Ehn test" conditions of the manganese and manganese-molybdenum steels we have used in the work to illustrate our remarks, shows that in the "as rolled" and "as tested" conditions there is little to distinguish a given coarse grained steel from its companion fine grained steel. The McQuaid-Ehn test, however, brings out fundamental differences in an obvious manner.

The carburizing test thus provides a simple and positive method of distinguishing between steels with a certain group of characteristic physical qualities and those with another but equally characteristic group. One may therefore predict with a considerable degree of confidence the suitability of a particular steel for a given application. It

is also clear that, for some applications, the group of attributes characteristic of coarse grained steels is desirable, if not essential, while other applications require fine-grained steels.

In view of these considerations it is inevitable that large users of steel, to whom definite physical characteristics are of prime importance, will use this test as a means of control, and perhaps incorporate grain size limits in the purchase specifications. This in turn would make it necessary for the steel maker to control the grain size of the steels he produces. For such work, the basic electric process offers peculiar advantages and has yielded excellent results. As was pointed out at the beginning, the ability of the large tonnage, high powered basic electric furnace to produce steels to close chemical and physical limits at a reasonable cost has led to an expansion in the use of electric steels which is most significant.

Business Press an Agent of Progress

President of United States Chamber of Commerce Points to
Valuable Services of Trade Publications

RAPID current changes in the business world demand that the trade press play an even more important role than in the past, according to William Butterworth, president of the United States Chamber of Commerce and head of Deere & Co., Moline, Ill., who addressed the Associated Business Papers at New York, Nov. 16. His remarks, in part, follow:

Enlightened business, eager to fulfill its destiny in the world, asks freedom of initiative. Properly so. But even paramount to individual right is the public right, and the individual who forgets that larger right must bring upon himself and his enterprises, and indeed more or less upon the entire business community, outbursts of public wrath in terms of legislative and Governmental regulation that may hamper and hamstring a legitimate liberty of business initiative.

Lawless, destructive initiative must be curbed. It must be curbed in the public interest and it must be curbed in the interest of lawful business. Organized business must and is lending a willing hand to this curbing through its own efforts at self-restraint and self-regulation. This aspiration is most worthy, and it is to the credit of the business press that it is bringing its influence more and more into aid of such efforts.

Moreover, in the solution of many of our business problems involving the public responsibilities of business, the sympathetic attitude of Government is necessary. This does not mean that business is—or should become—a petitioner for paternalistic legislation. But it is right and proper that business seek support for legislative policies that open the way for the collective wisdom of business to work out its own welfare, mindful that its largest good is always the public good. As the exponent of such aspirations the business press has before it an opportunity for most distinguished and most effective service.

Thus the success of business in measuring up to its public responsibilities depends in no small measure upon the courage of its organizations and the vision of its press. The organization is the business forum; the business senate. Here business canvasses and clarifies its opinion and arrives at its decisions. The business press—if it fully measures up to its opportunity—is the "guide, philosopher and friend," valued in counsel because it is as free to caution and to admonish as to approve and acclaim.

Let me elaborate that idea. I am a thorough believer both in business organization and in the business press.

Both are potent allies of business and industry. But let me say that the business press should not content itself merely with reporting business deliberations and business decisions. It should take part in them. And in saying this I have no thought to detract from the value of the reporting function. That I know to be most valuable—that interchange of business experience. It enables me as a manufacturer in Illinois to profit by the successful methods of others, and it enables me to avoid errors that have been discovered elsewhere. That, I repeat, is a service of the highest order.

But as a business man, as a manufacturer, as a member of trade and business organizations, I need, too, the candid advice of the business press. The business paper with its trained observers scanning the business horizon naturally has a wider view and an even better perspective upon the inter-relation of business events and movements than either the trade association or the individual business man. The value of this detached viewpoint and of the frank and friendly counsel of the business press cannot be too highly estimated. The business press has universal contact with business, it has the opportunity to mirror business to itself, and fearlessly to advocate sound policies and win for them the approval of both business and the public.

Moreover, never was the opportunity greater than now for the business press to make itself indispensable to business and industry. Never had it a like opportunity to stimulate leadership. For our business world is a rapidly changing world. In all its phases its processes are undergoing almost revolutionary readjustments. These require a new strategy, new tactics, new methods and, above all, unflinching fortitude and courage.

Standard Colors for Steel Foundry Patterns

According to a code of acceptable trade customs, adopted in 1928 by the Steel Founders' Society of America, the following colors should be used on patterns:

Surfaces to be left unfinished are to be painted black.

Surfaces to be machined are to be painted red. Seats of and for loose pieces are to be striped red on a yellow background.

Core prints and seats for loose core prints are to be painted yellow.

Stop-offs are to be indicated by diagonal black stripes on a yellow base.

Heavy-Duty Anti-Friction Bearings

Advantages Due to Power Savings, Reduction in Maintenance and Continuity of Operation—They Permit Some Things Otherwise Unattainable

BY SIDNEY G. KOON*

THERE are few machines the running of which may not be improved by anti-friction bearings. The action of articulations and of mechanical movements of any kind is improved by proper bearings, and the highest type of these is anti-friction. Even for bearings occupying a minor part in the machine, some form of anti-friction bearing may be said to be better and cheaper in the end. Our automobile development is largely predicated on ball or roller bearings.

In most cases the initial cost of an anti-friction main bearing may well be less than that of the plain bearings, when everything is considered. The plain bearing requires expensive white metal or brass; there is much scraping labor at high cost; and then in the installation in the machine the bearing has to be run in at further skilled-labor cost. With the anti-friction bearing, on the other hand, none of this cost is entailed; the bearing is finished in the plant where it is made, and it is then put into the machine ready to operate.

Roller bearings are designed with the expectation that they will last as long as the machine. While it cannot be claimed that they are free from trouble and occasional breakage, in general they are so much more dependable than the plain bearing that the maintenance cost of the latter is almost wholly an unbalanced charge, when the two are compared. Maintenance is the largest item with regard to a plain bearing. When such a bearing or a part which it serves becomes too hot, it may cause the shutting down of a whole train of equipment, with interruption of service, and involve a heavy loss of revenue.

Uniform Sheets Made Possible

Only three-tenths of the power originally employed on a sheet mill was required for rolling the product and overcoming what friction remained after roller bearings were installed.

Even this great economy in power, however, was not a compelling element in dictating the use of anti-friction bearings in sheet mills. The one item which did effect it was the fact that it was found extremely expensive to obtain uniform thickness to close limits across the width of sheets rolled on mills with plain bearings. And lengthwise of the sheet the uniformity often was so poor that measurements taken in fractions of one-thousandth of an inch showed that the material could not be used for certain exacting purposes.

This illustrates something which has been observed time and again in the installation of anti-friction bearings, namely, that the major economy or improvement is almost always not the one which is anticipated to have major value.

Life of Apparatus Prolonged

An installation in a tube mill operating on the Mannesmann principle is a case in point. A tailstock holding a mandrel bar was fitted with a multiple-collar bearing of the

marine type similar in appearance to the thrust bearing on a propeller shaft. The mill was producing about three tubes a minute. Sometimes this bearing was run only half an hour before renewal of the lining was necessary. The loss on the mill due to lack of production, expensive equipment idle, and ingots getting overheated became a very serious proposition.

Roller bearings were put in to replace the multiple-collar bearings. These are grease-lubricated and have been standing up for six months at a time, or longer, between adjustments.

A great economy here, however, in addition to overcoming the difficulties mentioned previously, was in the prolongation of the life of the piercer point. This point wore away very rapidly under the original conditions, because of the retardation to rotation, caused by friction. With the roller bearings the mandrel quickly rotates up to full speed, and saves wear on the point. The whole cost of this change-over was defrayed by the savings of a few weeks of operation.

Benefits Obtainable

Benefits to be expected from the use of roller bearings in mills are fourfold. They may be classified as (1) power savings; (2) reduction in maintenance; (3) practical elimination of repair costs; and (4) continuity of operation of the mills.

Much heat is generated in the journals when plain slide bearings are used. A considerable portion of this heat travels from the roll neck into the body of the roll and tends to swell it or otherwise to distort its shape. This makes it difficult to maintain exact sections or thickness in rolling. Roller bearings completely eliminate this source of trouble. While the working surface of the rolls becomes slightly heated by friction against the material being rolled, the influence of this heat can be readily controlled. In any case, it occurs equally whether the bearings be solid or anti-friction.

Considerations Regarding Design

MANY formulas have been developed by manufacturers engaged in designing and producing roller bearings for various purposes. Other formulas have been developed by theorists in dealing with the forces involved. But inasmuch as material such as steel distorts in use under heavy loads, the mathematical theory cannot apply directly to the specific case. Consequently, although a manufacturer may use the formulas in the preliminary stages of his design, he generally checks them against his accumulated experience, and almost always departs from them to suit varying conditions to be met. Any ball or roller bearing can carry a greater load than the theoretical formula provides.

As an instance of this may be cited the design of a roller bearing for a 400-ton revolving crane for pier use, in which the outreach over the edge of the pier was 50 ft. or more. Tests made with the bearings designed for this crane, under a load somewhat greater than that to which they would be subjected in practice, showed the surface of contact de-

*Associate editor THE IRON AGE. This is abstract of a paper read before the Iron and Steel Division at the annual meeting, New York, Dec. 7, of the American Society of Mechanical Engineers.

veloped between the cylindrical roll and a flat surface plate to be no less than 5/16 in. in width. Of course, neither roll nor plate—hardened tool steel as they were—was stressed to its elastic limit, both resuming their original shapes when the load was removed. Careful microscopic examination failed to show any remaining deformation in either element. But elastic compression in the material had provided adequate bearing area.

Because of this great width of contact line, in contrast with the hair-line of the theoretical formula, it became possible to load this particular set of rollers to as great as 19,000 lb. for each inch of length.

Revamping Old Mills Not Adequate

In designing a roller-bearing mill, the first idea is simply to put roller bearings on the necks of existing or conventional rolls. Where the problem has not been thought out more carefully than this, there have been many cases of failure. Study of the failures has shown either too high a pressure or too great a speed, or that the neck of the roll was too weak. This latter condition resulted from reducing neck diameters to permit the bearings to go into the limited space available.

High speed introduces serious complications in roller bearings as well as in other types. Small thrust bearings made some years ago for a machine which was to operate at 3600 r.p.m., and which were made at a tolerance of only 0.0001 in., gave a peculiar sort of musical note when up to speed. It happened that the rotative speed of the machine corresponded with the natural harmonic-vibration cycle of the bearing, with the result that at that exact speed the sound was caused. Several of these harmonic points may be reached by such a machine in getting up to speed, whereas a slight variation in some of the parts may remove any cause of trouble resulting from harmonic vibration at the designed speed.

Reversed Stresses Are Severe

Rapidly alternating tension and compression in the material of roller bearings constitute more severe usage than is customarily experienced in the working parts of other machinery in which the alternate application and relieving of only one kind of stress is encountered, either tension or compression. It is well known that the extremely rapid repetition of stress alternating from tension to compression produces early fatigue. On account of this severe nature of stressing, the loading of roller bearings is frequently limited to only 1 per cent of the static load which could produce rupture of the parts.

Three essentials characterize the building of roller bearings today: The first is steel of proper composition and properly manufactured for both rollers and races. The second is accurate temperature in the heat treatment of the finished parts, which customarily must be kept within plus or minus 8 deg. of the specified temperature, and should be kept within 3 deg. The third is the extreme precision of the final finishing on the grinding machine.

For speeds as high as 400 or 500 r.p.m., it is strongly felt that the inner races should be locked in position on the roll neck. This may be done by clamping, by a shrink, press, or tapered fit, or by a combination of these methods. If this is not done, wear and scoring may result between inner race and journal. But with any type of bearing requiring endwise adjustment, the race must be free to slide on the neck.

Tapered and Cylindrical Rollers

Both tapered and straight cylindrical roller bearings are likely to find a place in rolling-mill work, for each presents certain advantages. But the results so far are not in sufficient detail, and particularly not yet in definite enough contrast to make possible intelligent selection of the one rather than the other.

In either case it probably will pay to install over-capacity anti-friction bearings for this service. Though they are costly, mill delays are far more so. And it is much better to face a high initial investment in bearings which will stand up for a long period than to have expensive mill delays and the more frequent replacements which might naturally follow the installation of bearings of smaller capacity.

Heavy Guns Use Anti-Friction Bearings

Anti-friction bearings have been introduced widely into the mechanism of gun carriages. The lower pintle thrust bearing for the United States 14-in. railroad mount—by far the most powerful gun used by either side on any front during the World War—has 34 balls 4 in. in diameter in hardened steel races having a diameter of 51½ in. at the center of the balls. The traveling weight of this mount is 730,000 lb.

Both races and balls are made of chrome-bearing steel, hardened and ground, with a Shore scleroscope hardness of 90 or above. The races are capable of carrying a sustained load of 100,000 lb. on one ball, applied at any point in the circumference of the groove. Each ball will stand a load of 100,000 lb. when placed between the finished races without showing any permanent deformation or surface cracks.

Some of the pressure tests on bearings have shown the maximum loads to which the roll neck may be subjected in operation. As the maximum load may occur only at long intervals, and, further, as it may be only momentary in application, it does not furnish a wholly satisfactory figure for the designer to use. Neither, in fact, does the average load, for the bearing must be fully capable of taking an overload which may in some cases be severe. Just where, between the maximum and the average, lies the load proper to use for designing is for future experiments and experience to determine.

Vital factors in designing bearings stated recently in connection with bronze bearings for heavy duty, will apply also for the most part to roller bearings. These include the following:

- Horsepower to be transmitted
- Revolutions per minute
- Load per square inch of bearing area
- Character of workmanship in machining parts
- Type of material used and its hardness
- Whether grinding to accurate measurement is to follow hardening
- Proper allowance for oil film
- Kind of lubrication to be used
- Lubricating device (if any) to be employed
- Type of service—intermittent or continuous
- Consideration of the heat to be developed by friction, and its proper radiation and control.

Operating Conditions and Requirements

CONTINUITY of manufacturing operation is today one of the most important elements in our industrial fabric. Continuous processes, particularly where operating with a long train of equipment, give economies not possible under the old conditions. Interruption to this continuity is bound to be exceedingly expensive. A large plate mill installed in Eastern Pennsylvania, for instance, has a charge of \$90 an hour for interest, etc., against every operating delay. It is evident that even a 15- or 30-minute shutdown to replace a brass on a \$3,000,000 mill, if recurring frequently, is something which industry cannot permit.

In rolling sheets or strips any change in the shape of the roll due to heat is important. Heat is conveyed to the roll from the material being rolled, and from the heat generated in brass or babbitt bearings. By the use of anti-friction bearings on supporting rolls, the heat in the necks is reduced to a more or less fixed quantity and the operator has only to shape his rolls so that they will adjust themselves to the accumulated heat derived from the material

being rolled. This tends to make it easier for the operator to maintain the shape of his mill. Because of the thinness of the product, this matter is of a greater importance than when rolling heavier sections.

Backed-Up Rolling Mills

Large-diameter backing rolls on cluster mills and four-high mills are depended upon to stiffen the working rolls and to limit their deflection, so as to produce a rolled strip or sheet with a minimum amount of variation between center and edge. When the supporting rolls are equipped with roller bearings, less adjustment is required to maintain the gage of the strip, as the operator has only to watch the wear on the roll surfaces, and does not have to make allowance for wear on the neck bearings.

With this equipment, properly designed, it is possible to roll strip or sheet steel practically without a "high center" and without crowning the rolls. The great diameter of the backing-up roll in relation to its length minimizes deflection of the working roll and enables the mill to produce the desired result. Roller bearings on the backing-up rolls make possible a high uniformity of gage, longitudinally, on many pieces rolled in succession, because the wear in the bearings is negligible.

There seems to be no question that a sleeve bearing, when first installed, will turn out material equally close in tolerance to that made when anti-friction bearings are employed. But the wear on the plain bearings is so much more rapid than on the anti-friction type that its tolerance changes more rapidly. Under these conditions the mill with the sleeve bearing demands a great deal more attention and adjustment. Plain bearings, of course, do not wear down equally, and some retain their forms longer than others. Nevertheless the general statement that they wear much faster than roller bearings probably will not be disputed.

Developed Side by Side

Thus the small-diameter working roll, backed up by one or more larger rolls, has been adopted for rolling wide, thin materials. By their very design and construction mills thus built avoid the space limitations around roll necks existing in regular two-high and three-high mills. It was quickly recognized by mill builders and roller-bearing manufacturers that here was an ideal opportunity for them to cooperate in applying roller bearings. And thus the activity of the bearing manufacturers in applying roller bearings to mill necks coincided with the reintroduction of backed-up rolls for mills rolling sheets and strip steel.

Backing-up-roll diameters may be established without regard to any factor except the space requirements of the roller bearing. In fact, the greater this diameter the better suited is the big roll to hold the working roll from deformation. It was the perfection of this combination which started the recent and remarkable change from the long-established practice for producing wide, thin metal products.

Older Types Still Useful

There still is a wide range of products which can be rolled satisfactorily on the older type of two-high mill without undue power drafts. In such cases, particularly under present steel-mill operating conditions of frequent roll changes, brought about by the "short orders" of "hand-to-mouth" buying, the installation of roller bearings might not be justified. Against their manifest advantages must be set the higher cost of roll changes in sets where they are employed. If analysis shows that the latter is likely to exceed the savings expected from their use, the lower initial cost of present equipment may well be decisive.

Freedom from shutdowns for repairs is one of the chief advantages derived from the use of heavy-duty roller bearings. On some mills it has been found necessary to re-babbitt bearings as often as every 8 hours, while properly applied roller bearings frequently do not have to be replaced

more than once a year. When rolling continuously it is essential that the bearings stand up to their work to avoid having to shut down the whole mill for replacements.

Savings in Power Consumption

COMPARATIVE power-consumption tests on mills run alternately with anti-friction bearings and plain bearings have yielded valuable data. Variations in temperature of the steel being rolled have made the tests less directly comparable than might be wished, but the information available is being augmented from time to time by additional test data. The earliest, and possibly the most complete, of these tests were made on a three-high 16-in. bar mill in Canton, Ohio. Records of the rolling of 279 billets, in tests made two and a half years ago, showed average savings of about 48 per cent.

In another case a two-high 10-in. rod mill was tested both with plain bearings and with roller bearings. With plain bearings the power needed without load was 95 hp., increasing to 170 hp. while rolling steel. With roller bearings the no-load requirement was only 20 hp., and 95 hp. while rolling steel. Here the saving of 75 hp. represents 44 per cent of the previous full load of 170 hp.

Questionnaire

UNDER the auspices of the Association of Iron and Steel Electrical Engineers a questionnaire was sent out last spring to determine the position of steel-mill engineers with regard to the application of anti-friction bearings to roll and pinion necks. Some of the results of that questionnaire are given in the following paragraphs.

Roll necks, in general, can be reduced in size if anti-friction bearings are applied. The point of application of roller bearings is closer to the body of the roll than in the case of plain bearings.

Backlash presents quite a problem because its elimination by means of drags would materially reduce the power savings afforded by anti-friction bearings. Ordinary coupling-box fits in many cases cause serious backlash. Better-fitted finish on coupling boxes and wabblers would help but not cure this condition. Such fits would have to have clearances estimated variously at from 1/16 to 1/2 in., with 3/8 in. generally favored. Universal couplings would be preferable to finished boxes and wabblers, except perhaps for small bar mills.

Freedom from Dirt Important

Prevention of dirt working its way into the bearings is one of the most serious problems. Proper lubrication of the bearings must be worked out in a simpler, yet reliable, manner.

That there is virtually no wear on roller bearings, either transverse or longitudinal, will, it was reported unanimously, eliminate much trouble in mill operation and prove of great value. It will help the mills to roll more accurate products. That it will lengthen the time between roll dressings is doubted.

The chief limitations to the installation of anti-friction bearings for this service were given as lack of necessary space on old mills, limits to roll dressing, high cost of equipment, and—mental inertia. Some of the disadvantages of such bearings were listed as increase in time required for changing rolls, inability to take end thrust, and inability to obtain full life out of rolls on small three-high shape mills.

General Conclusions

APPLICATION of roller bearings to the backed-up strip mill is still too close to the experimental stage to permit drawing any definite conclusions as to what its final form will be.

How much load a roller bearing will carry, and how long it will carry that load satisfactorily, are not yet known.

It is comparatively easy to determine the load which ordinarily comes on a roll neck. But there are excessive momentary loads far higher than this, and it is a very difficult matter to design a bearing which will carry these loads satisfactorily for a considerable time. The trend has been along the line of making bearings larger and larger with each new mill.

That this is an empirical method of attacking the problem, no one can deny. But it has resulted in developing equipment better suited to long life and inexpensive main-

tenance than would have been obtained by less bold design. So far we have not been able to determine exactly what does fix the size of a roller bearing.

Steel-mill engineers who have adopted roller bearings for rolls on backed-up mills, and who recognize their great utility for that purpose, do not favor their indiscriminate use elsewhere. As one such engineer puts it: "The present state of development in roller bearings for main mill rolls does not warrant our consideration of them except in cases beyond the limits of the two-high mill."

Limitations on Use of Anti-Friction Bearings

OPENING the discussion on the paper on Heavy-Duty Anti-Friction Bearings, F. C. Biggert, Jr., chief engineer, United Engineering & Foundry Co., Pittsburgh, who presided at the meeting, pointed out some of the limitations to the use of such bearings. There is a constant tendency to keep down their size, both on the score of cost and on that of convenience in handling. There are distinct limitations in regard to their use on two-high or three-high mills, because of the lack of adequate space between the roll necks in which to place the bearings. Where the material going through such a mill is narrow, as bars, they may work in these cases, but for broad material, heavy draft and large loads they are inadmissible.

Rarely do the rollers of such bearings give trouble; the races may do so because of the difficulty in obtaining uniform heat treatment on units of the size which the races take. They are frequently 30 in. or more in diameter and allowance must be made for the excessive loads sometimes placed upon them by reason of accidents. Mr. Biggert told of one instance in which a race of 18 in. in diameter was taken from the mill in a badly scored condition over the full 10 in. of width and for nearly one-third the circumference. There were minute particles of steel within the bearing but it did not give particular trouble, in spite of the damage it had received. This sort of damage was reported as customarily progressive, and usually the bearing gives no sign of distress until long after it has been seriously hurt.

Semi-annual or annual inspection of bearings were reported as inadequate by C. W. Bennett, vice-president American Sheet & Tin Plate Co. He advocated much more frequent inspection and said that with this it might be possible to obtain warning of internal troubles. Power savings were reported by Mr. Bennett to vary considerably with the type of mill and the character of product being rolled.

Heavy Savings from New Bearings

Referring to advantages not looked for when anti-friction bearings are installed, G. W. Weckstein, industrial equipment engineer Timken Roller Bearing Co., Canton, Ohio, said that his company has been able to get a more nearly concentric tube on a seamless mill after the new bearings were put in. The annual cost for brass and labor, in replacing or renewing plain bearings on this mill, had been \$6,059, without any allowance for overhead. The cost of a set of bearings for two rolls was given as about \$1,000. These were placed on the necks of the Mannesmann piercer rolls.

Mr. Weckstein referred particularly to the relation between cost of anti-friction and plain bearings on spindles of machine tools. He stated that the roller bearing in operating condition on the tool represented considerably less expense than was entailed after all the scraping and fitting had been done with the other type.

Complete study of pressures and power consumption is about to be undertaken by the Timken company, said the speaker. All three of the pressure measuring methods

mentioned in the paper are to be used, partly to learn their limitations and how they check each other.

Use of grease in excess quantities for the purpose of keeping foreign matter out of the bearings was advocated. In particular it was regarded as essential to retain the grease in the bearing and to keep water out. Because of the wear concentrated on one portion of the race of such a bearing, if it is fixed in position, the speaker said that longer life could be obtained from the equipment if, after a certain period, the race were turned 180 deg., so that the load might come elsewhere. He suggested a "creeping fit," whereby the loaded area might be shifted.

Oil-film bearings were warmly defended by H. A. S. Howarth, vice-president and general manager Kingsbury Machine Works, Philadelphia. He referred to the oil-film bearing as the best type of plain bearing, and described steel men generally as exceedingly conservative and hesitant to put in new devices. He said that the frictional coefficient at the moment of starting a piece of equipment is high with the oil-film bearing. Later on, however, this becomes much lower and approaches its best at the upper limits of speed. This type has great overload capacity.

Grease Under Pressure Keeps Bearings Cool

Positive grease lubrication on the necks of rolls on a 32-in. reversing mill rolling rounds was referred to by George T. Snyder, chief engineer National Tube Co., Lorain, Ohio. This mill has plain bearings and considerable water was formerly run on the necks to keep them cool. The grease lubrication installed provided for a pressure of 2000 lb. to the sq. in. and pockets around the necks were provided to hold the grease. The equipment is so adjusted that a little grease is supplied from the system every time the mill is reversed. No water is now needed on necks.

Strain gages in conjunction with steel blocks used well within the elastic limit of the steel was stated by Alvan L. Davis, research engineer Scovill Mfg. Co., Waterbury, Conn., to be the best method of measuring rolling pressures. He reported experiments upon a small sized mill placed under a large testing machine. The results were expanded mathematically from the 4-in. width in the experimental mill to 20 in. Strain gages now on the market were reported as sensitive and working beautifully.

Anti-friction bearings have been developed and pushed by their friends, according to William L. Batt, president S K F Industries, New York. Information has been pooled and all have benefited in the way the bearings have been improved and developed. This has not been the case with the plain bearing. No one in particular was engaged in pushing it. What was everybody's business became nobody's business and development of that type of bearing unquestionably has suffered in consequence.

A plea for using larger rolls with anti-friction bearings was made by W. Trinks, professor of mechanical engineering, Carnegie Institute of Technology, Pittsburgh. He recommended adding an inch to the diameter of small rolls, 2 in. to medium-size rolls, and 4 in. or thereabouts to larger rolls, when these bearings are to be applied. The

recommendation was based largely upon the inadequate room between roll necks for installation of anti-friction bearings on two-high and three-high mills.

Bearings Fellowship Suggested

At a luncheon meeting following the presentation of this paper and the discussion upon it, it became the consensus of opinion of those present that the work of the subcommittee on bearings could best be promoted from a

collection of all existing data, a survey of peak loads experienced in mills, and a study of means for avoiding the occurrence of these peak loads. A fellowship in the Carnegie Institute was recommended, the work to be done under the supervision of Professor Trinks, but with consultation with experienced men in and around Pittsburgh regarding methods and many other details. Representatives of bearing manufacturers, present at this meeting, offered to obligate their companies to share in the expense.

Functions of the Executive in Industry

Strong Plea Made for More General Adoption of Budget Control System in Manufacturing Plants

THREE main tools—men, money and materials—must be coordinated for best work in any manufacturing organization. The budget by which this coordination takes place is the most efficient tool known to modern industry, in the opinion of Robert T. Kent, engineering and sales manager Divine Brothers Co., Utica, N. Y., in a paper read Dec. 6 before the American Society of Mechanical Engineers, New York. It coordinates all four of the principal activities of a plant—finance, purchasing, production and sales. One of its chief advantages is that it permits comparisons of performance with the budgeted expectation, and thus points out where variations occur and to what extent. Hence, it shows where improvements can be made and how much room there is for them. The budget shows

- 1. The volume of business that can be expected
- 2. The volume of purchases, both of labor and material, that must be made
- 3. The production schedule that must be maintained
- 4. The probable inflow and outgo of funds
- 5. The financing that may or may not be necessary to carry on the business.

Budgets are of little use, according to Walter N. Polakov, engineer, New York, unless an executive can thereby measure the success of his efforts. He must compare with his postulates that which is accomplished. Any charted budget means more than merely a budget of money. It compares performance in various ways, accidental happenings, turnover of labor, etc.

Illustrating by an example drawn on the blackboard, which roughly is reproduced here, Mr. Polakov showed results which were obtained in a certain period in a plant employing 340 men. The monthly output of products was about \$200,000. The amount of stock carried was about \$100,000 and the monthly payroll, \$36,000. This was worked out on the dollar basis, partly because there were six different products made, which could not otherwise be grouped over any common denominator.

As will be seen in the chart, the plotting for any one month showed visually whether the volume of production was up to the bogey, or, if beyond that, by how much. The heavy black line indicates the quarterly accumulation of the three months in the quarter.

Quality was measured on the basis of spoiled work, allowances to customers for defectives and other items which could be placed on this same general basis. The allowance here was \$1,000 a month or ½ per cent of the product. As plotted, it will be noted that this did not quite reach the allotted bogey in any of the months, and the quarterly total thus fell below what was permitted. Stock and other items can be plotted in the same manner.

Method of Subdivision

While the manufacturing budget is necessarily tied up to the main financial budget of the company, Mr. Kent said,

it is at the same time broken down for plant control into materials, labor and indirect costs. This is done by departments and the individual figures are accumulated into the total. The material figures are taken from the purchase orders. The labor is predicated upon the estimated machine-hours for the month's production. The indirect labor is a percentage of the direct or a unit based on the machine-hours. For the most part, in the shop the units of the shop are utilized and the amounts are not expressed in dollars.

Nevertheless, the department heads are kept acquainted

Illustrating One Graphic Method of Budget Control as Applied to a Plant Employing 340 Men

with the situation as to how much money they can spend for various purposes. This is subdivided into labor and other items and is given either monthly or quarterly. Each department head is thus made the manager of his own department.

Trying to Improve on Past Performance

Another speaker, reporting that he had never used a budget as such, stated that he has applied the general principles. In doing this, he took the best figures obtained for each department and endeavored to improve upon them. No limits to this process have yet appeared, as progress has been continual. He made a definite plea for not forgetting the human element in any budget making.

Dollar values can be carried down to the shop in their relation to the budget, according to the chairman, Thomas R. Jones, Cincinnati Milling Machine Co., Cincinnati. In plants with diversified products particularly, the materials, labor and other items have no other common denominator. While it is always possible to allow so much oil or waste for each 1000 ft. of pipe, or whatever else is made, the matter cannot be evaluated in a managerial sense without translating everything into dollars.

Skids for Interplant Shipments

Symposium Covers Economic Aspects, Railroad and Steamship Viewpoints and Development of Methods and Equipment

SIX papers were read before the Materials Handling Division of the American Society of Mechanical Engineers, at the recent annual meeting, dealing with the use of skids in shipments to distant points, as distinguished

from use of that form of equipment within the confines of a plant or between neighboring plants. Brief abstracts of the papers, and the discussion which they evoked, are given in the following paragraphs.

Developments in Materials Handling

IN the period from 1890 to 1910 a revolution was accomplished in methods of handling bulk goods, according to R. L. Lockwood, Division of Simplified Practice, Department of Commerce, Washington. This period saw the greatest development in the power shovel, the huge unloading and loading machines for railroad cars and ships, the great bridge and gantry cranes, the continuous conveyor and many other devices. During the early years of the twentieth century engineers made rapid progress in developing new methods for handling materials of construction, and an equally intensive development went on in methods of handling goods in process in factories.

Up to the time of the World War little attention had been paid to handling finished goods. During the period in which the skid and lift truck were extensively developed, a parallel development took place in connection with industrial tractors and trailers.

Materials-handling equipment of every kind can be counted upon to save its full cost within a definite period of time. Savings due to labor and time-saving equipment in many fields are sometimes partially offset by collateral losses in changed methods, inconvenience, or some other form of unavoidable waste. Handling materials is almost in a class by itself in this respect, in that savings made represent net gains shared by all elements in industry.

A fundamental economic principle has been concisely expressed in a form which might well become a slogan for the materials-handling industry: "Handling materials adds cost, but adds no value." It is to reduce this cost to the lowest possible measure that materials-handling equipment is employed.

Skids Are of Ancient Vintage

One of the oldest devices in the whole history of moving objects, the sled or sledge, had unrecognized possibilities, and after a long lapse of years was brought to life in the form of the modern skid platform or "skid." All sorts of objects could be loaded on it, and by the use of the lift truck the loaded platform could be picked up, taken to any desired place, and set down again.

Lift trucks grew in size and capacity, power being

applied to them in many cases. More and more plants began to use this method for handling a wide range of commodities. Loads increased steadily to a point where lift trucks are now made to handle loads up to 10 tons, although the average is 2½ to 3 tons. Once the ancient sled and the modern lift truck had been brought together, their use in combination spread so rapidly that it is estimated that about 9,000,000 skids and 110,000 lift trucks are in service in the United States.

During the period in which the skid and lift truck were extensively developed, a parallel development took place in connection with industrial tractors and trailers, particularly for use in railroad freight stations, warehouses and steamship terminals. Numberless forms of hand- or power-drawn trucks and trailers rapidly came on the market, all designed to reduce the time and the labor cost of handling miscellaneous goods.

Large Reductions in Cost

Handling costs in railroad freight stations were reduced from 25 to 75 per cent. A study made by the Transportation Division of the Bureau of Foreign and Domestic Commerce, covering miscellaneous commodities, showed that, of every dollar spent to get these commodities from the final machine or factory process into the hands of the consumer ready for use, 10c. represented the actual rail or water transportation cost and 90c. the cost of packing, handling, loading, unloading, rehandling, unpacking, etc., including the cost of packing materials.

This study, together with others of a specific nature, attracted wide attention on the part of engineers and executives, as indicating the vast and untouched possibilities for saving money in this field. This knowledge, together with the constantly narrowing opportunity for saving money in production processes, further accelerated the effort to reduce costs in handling finished commodities.

It was obvious that, if the same degree of engineering, inventive and administrative genius were applied to distribution that had already been applied to production, the results would be similar to those accomplished in production in this country.

Economic Aspects of Skid Shipments

SOME of the economic aspects of the skid method, viewed purely from the standpoint of the shipper or receiver of the material, were presented by C. B. Crockett of the Society for Electrical Development, New York. The method is described both as to equipment and its uses, and to its relation to the manufacturing processes. A comparison is made between the total cost of physical distribution and

the cost of freight transportation only, pointing out the small influence of the latter factor in the total cost. The field of savings is then discussed, including labor costs, speed of car loadings, the container or skid, and the damage to material. These are illustrated, with actual instances which have occurred in various industries.

The paper concludes with a treatment of the possible

growth of the system and the four main factors which may influence its more general adoption: namely, (1) breadth of application to different commodities, (2) coordination of the system with methods of handling within the plant, (3) attitude of the railroads and other carriers, and (4) degree of interchangeability developed in the design of the equipment.

The essential factor in this method is the introduction of a container for shipment which adapts itself to mechanical handling in and out of box cars. Even with the use of portable conveyors there is still a large amount of

"load-carrying" truck (either hand or powered) in that they pick up the load mechanically and in the minimum time. The requisite for handling with this type of equipment is that the load be carried in a container that has a clear space underneath, which will allow inserting the platform of the truck underneath the load.

A packing case with legs becomes a skid box. The general practice today is to load the skid platform or skid box at the completion of the manufacturing process, storing the material in the same container, and upon shipment transfer the loaded skid to the car. If a platform is used for such

hand labor in the placing or removing of material in or from its location in a car. The only practical means (or at least the most generally accepted means) of mechanical handling in and out of box cars is by hand, electric or gasoline-powered industrial lift trucks.

Capacity of Laborer Multiplied

All of these types of lift trucks have a common characteristic in that they multiply the capacity of the workman and have the improvement over the fixed-platform or

material as kegs or small boxes, these are generally wired or strapped together, but do not have to be secured as strongly as one would suppose, because the entire load is generally secured after the car is loaded.

Many specific instances of savings made by this method of shipping, and of other opportunities for further savings, were cited by the speaker. He threw on the screen a diagram showing steps in shipping semi-finished goods from producer to the plant where further work is to be done upon them. This diagram is reproduced herewith.

Use of Skids for Water Shipments

ECONOMICAL handling of commodities in bulk has been highly developed, but great reductions in costs are possible with other classes of cargo by the use of advanced methods and equipment and the application of principles which have accomplished so much in manufacturing. The principles of greatest importance are the reducing of handling to the minimum and increasing the production of equipment to the maximum, according to H. E. Stocker, resident manager McCormick Steamship Co., New York.

In the shipping industry handling may be reduced by keeping freight off the floor of the pier and the deck of the ship. The best method of accomplishing this is to receive the freight from the manufacturer, already loaded on a skid. It broadens the application of the principle by extending it back to the mill where the goods are manufactured. Savings are increased not only by reducing handling at the mill and at point of consumption but by reducing packing expenses.

Saves Four-Fifths of Labor Cost

With a pier floor in good condition, one man and a tractor will handle skids averaging 3600 lb. with a total labor cost saving, as compared with shipments in cases, of

over 80 per cent. Even more important from the standpoint of net profit is the fact that additional business has been brought to the line by accepting shipments on skids.

In addition to the economy resulting from handling skids on the pier with lift trucks, the average sling load will be increased approximately 300 per cent, the ship's dispatch will be expedited, and the claims reduced. Total savings will be the equivalent of more than a 50 per cent cut in cargo-handling expenses.

Advanced principles of materials handling will add greatly to these benefits by reducing cargo-handling costs. The principles of most importance are:

- 1—Avoid unnecessary movement—i.e., straight-line production,
- 2—Maximum use of mechanical equipment,
- 3—Entire operation planned carefully to the last detail,
- 4—Select the one best machine, etc., for each particular job,
- a Be familiar with all equipment on the market,
- 5—Select the one best method for each particular job,
- 6—Emphasize unit cost rather than first cost, and finally, emphasize net profits,

7—Provide for ease of movement

- a Ball-bearing or roller-bearing trucks, trailers, etc.
- b Good floors
- c Movement by power

8—Minimum of handling

- a Economy in moving material is obtained by not handling it,

9—Maximum production obtainable from the equipment and plant.

Savings in Handling Railroad Stores

TREMENDOUS quantities of stores are handled by every American railroad. These stores are to a large extent received in a central store room and are then forwarded as needed to local storerooms in various centers. Under ordinary conditions this procedure involves considerable re-handling, according to J. V. Miller, assistant general storekeeper, Chicago, Milwaukee, St. Paul and Pacific Railroad, Milwaukee.

During the past few years the C. M. St. P. & P. R. R. has succeeded in cutting down this rehandling by storing many of its supplies on skid platforms. When shipments are made up to send out to the local centers the supplies are thus to a large extent picked up directly on the original platforms by means of lift trucks, moved into the railroad cars, transported to their destination and there unloaded by lift trucks. Three handlings are thereby eliminated.

Vast Movements Involved

Approximately \$1,000,000,000 worth of materials annually must be handled by railroad stores departments.

Some railroads carry in stock 65,000 different items of material; some carry over 100,000 items. The supply department, more commonly called the stores department, of each railroad orders stores and distributes them to the using departments in much the same manner as a large wholesale house serves its customers.

Not less than 75 per cent of the work of the stores departments is that of handling materials, yet until a few years ago the major efforts toward more economical operation were directed along lines other than those of materials handling.

Taking up in order the subjects of brake shoes, air pumps, brake beams, locomotive tires, air hose, journal brasses and other items of large use in railroad work, the author showed to what extent each such item fitted into the general scheme of handling on skids. In some cases the "adherence" is 100 per cent, but some items prove difficult to take in that manner and here less benefit is obtained from the new methods. Particularly is it found impossible to handle long items on skids.

Skid-Platform Shipment of Commodities

AFTER outlining the development of the use of lift trucks for interior factory transportation, F. J. Shepard, Jr., chief engineer and treasurer, Lewis-Shepard Co., Watertown, Mass., briefly discussed their possibilities for inter-plant transportation and for use between cities through freight and motor-truck shipments. He showed how the methods of packing and transporting paper have been radically changed in the past two years through the use of skid platforms for shipment, and gave figures of savings effected in a number of instances.

One has only to go back 20 years to the starting of the lift-truck system. Up to that time everything was handled on wheel trucks. Lift trucks were first used on flat stock such as paper, lumber cut to size, etc. The only type of platform used was the flat-top type made of wood.

Every use for lift trucks developed since that time has been the result of applying a proved principle to a particular problem. And when it is considered that lift trucks are used today to handle over 300 different products and in loads from 300 to 10,000 lb. (20,000 lb. in the case of power-

lift trucks) with platform sizes ranging from 3 sq. ft. up to 48 sq. ft., we can appreciate how unlimited the possibilities are.

Saved 3 Per Cent on Selling Price

One large paper mill estimates that \$30,000 invested in returnable skids paid a 100 per cent dividend at the end of ten months' use, and since that time has shown a saving of better than \$120 for each working day, or \$36,000 a year. The direct saving at the mill, through this method of shipping, amounts to about \$5 a ton, or, roughly, 3 per cent of the selling price of the paper.

Manufacturers of lift trucks and platform skids are anxious to cooperate fully, not simply to make sales but to build better transportation systems; for they realize that if they do that, or help to do it, sales will result as a matter of course. They have a wealth of material along various lines, plus the experience gained in working out problems, and in most cases are able to offer helpful suggestions to those who may be considering special handling problems.

Skid Shipments of Materials on the Lakes

SKID platforms, stock skid boxes, power-lift and hand-lift trucks in the handling of cargoes in Great Lakes navigation were discussed by George B. Wright, freight traffic manager Detroit & Cleveland Navigation Co., Detroit. He pointed out that the greatest problem to be faced is the practicability of interchange between carriers and between carriers and industrial plants. The solution he believes can be arrived at only through discussion between representatives of industries, steam railroads, electric lines, steamer lines, city transfer trucking companies and storage warehouses.

Cargo carried by the combination passenger and package-freight side wheelers, ranging from 360 to 535 ft. long, is perhaps more diversified than that of other similar car-

riers on the Great Lakes. It ranges from packages a few ounces in weight to iron and steel articles and machinery weighing several tons—literally, everything from "a needle to an anchor."

In addition to this miscellaneous freight many thousands of automobiles are carried on their own wheels. To carry maximum loads of automobiles the miscellaneous freight must be stowed from deck to deck, with proper regard to the utilization of space in which an automobile cannot be placed.

Skids of Goods Can Be Stacked

It was found that skid platforms and boxes when evenly loaded with heavy, compact freight could be so placed on

the boat decks as to form in reality a deck of themselves, and that quantities of lighter freight could be loaded on top of their loads, so that the only space really lost was that between the legs, which was negligible. The scope of the work was then enlarged by employing power-lift trucks to do the work between the boats and the docks and using hand-lift trucks for moving the equipment only short distances. Today the company has in service about 400 skid platforms and skid stock boxes, which are interchanged between ports carrying local port-to-port freight only.

Interrogating himself, the author tries to answer these questions.

Many Points Raised and Answered

SKID platforms were first used for outside shipments in the pulp and paper industry about 12 years ago, according to Prof. Frank L. Eidmann of Princeton University, in opening the discussion. Two factors, however, have retarded the rapid adoption of this method. The first is a lack of interchangeability in the skid platforms and the second, the failure of management to appreciate the savings which may be achieved through their use. One thing not commonly noted is the reduction on demurrage charges, based on more rapid handling of goods into and out of freight cars.

Interchangeability of platforms between the carrier and the manufacturer must be possible for best results, according to James E. Mix of the Excelsior Lift Truck Co. Consequently, all such platforms must be made to the same standards. Illustrating the result of a lack of standards, Mr. Mix pointed out that his company makes more than 80 sizes of lift trucks—not from choice, but because there is specific demand for each size. He believes that the number should be cut to 12 or 15.

Handling stores in the general storehouse of the Illinois Central Railroad is done about 95 per cent on skids, as reported by W. S. Morehead, assistant general storekeeper. There are something like 47,000 items in stock. Such of this as cannot be skidded is the material of long length, such as pipe, steel bars, etc. Skids are used for this purpose by this railroad for three reasons: the saving in labor, in storage space and in stock investment.

When to Buy Skid Equipment

As a general guide in this connection, Mr. Morehead said that a lift truck and 200 skids should be installed whenever the working force reaches six men. With this equipment, the force of six may be cut to four and the work done more expeditiously and at less expense.

One interesting suggestion made by Mr. Morehead with regard to the locating of skids on a narrow aisle was that they be placed herringbone fashion (as shown in the sketch), so that the lift truck can get at them. Under this arrangement, a 6-ft. aisle will be just as easy to work as a 12-ft. aisle, which is required if the skids are placed rectangularly.

Taking up five questions propounded in the paper by George B. Wright, Matthew W. Potts of the Alvey-Ferguson Co., New York, gave categorical answers to each question. As to who will furnish the equipment—the shipper or the carrier—he said that this comes down to a question of which one will save the most money. In any case, the major portion of the saving will or should be passed on to the consumer, and the ownership of the skid becomes matter for mutual arrangement between shipper and carrier.

Wire-Mesh Container Suggested

Checking loose freight going through several hands sometimes involves drastic precautions. Mr. Potts suggested a wire-mesh container erected on a skid and fitted

- 1—Who is going to furnish the equipment, the shipper or the carrier?
- 2—How is the freight going to be checked by the carriers? This involves the checking from shipper to first carrier, first carrier to second carrier, and so on, and last carrier to consignee, or last carrier to drayman to consignee.
- 3—How is the owner of the equipment going to get it back?
- 4—How are the repairs going to be handled? There is a constant upkeep on this type of equipment.
- 5—Where the loads are preponderantly one way, how is the equipment going to be equalized?

with a lock or other form of seal. The shipment then can be handled as a unit without necessity for checking over a multitude of small items to ascertain whether pilferage has occurred.

As to how the owner of the equipment (skids) can get it back after shipping out goods on it, this is handled in many cases by shipping the skids back as a separate freight item. As a matter of fact, much of the work of the Department of Commerce on standardizing skids paves the way for re-use of the equipment in many places and makes it possible to make a definite charge for the skid, which

Illustrating Locating of Skids Herringbone Fashion, to Permit Use of a Narrow Aisle. Owing to the full turn needed by the lift truck for the usual method of location, a 12-ft. aisle is required, whereas 6 ft. will do, with 45-deg. angle of "parking"

charge is refunded or canceled if and when the skid comes back.

Repairs on a type of equipment on which continual upkeep is a factor will naturally be made by the owner. Where the loads are preponderantly one way, equalization of the equipment again takes the form of making a charge for each skid and a credit on its return.

Interchangeability Has Been Fostered

It was pointed out by R. L. Lockwood of the Division of Simplified Practice, Department of Commerce, Washington, that standards for skids have been discussed by the department but not yet adopted. The general feeling is that standards should result in making skids of multiple sizes, wherein the larger is twice the area of the smaller, etc. Opinion is about crystallized on sizes so that two of the large ones or three of the small ones can be placed abreast in a box car.

However, great progress in interchangeability of skids

has been made without standardizing the over-all dimensions. Standard heights have been widely adopted, so that the tables of lift trucks can be inserted comfortably, and clearance widths between legs have been broadly accepted for the same purpose. This makes it possible to handle a wide variety of skid sizes with such variety of lift trucks as the market affords.

Shipments of steel on skids, particularly in the form of cold rolled sheets, was referred to by B. F. Neidinger, Singer Mfg. Co., Elizabethport, N. J. Because of danger of corrosion from the elements, this steel is shipped in box cars. The speaker asked whether it could not just as well be put in open cars, with enough protection from the weather, and then handled from the car by a crane and put on the company's own skids for working through the plant.

Costs of Unloading Cut Heavily

Unloading costs on box cars were referred to by F. D. Stemp of the General Electric Co., Bloomfield, N. J. With sheets unloaded by hand, the cost was placed at 65c. a ton. Upon using a dolly this cost became only 8 to 14c. a ton, depending somewhat on the way it is packed in the car. This question of packing in the car was referred to by C. N. Bonnell, Jr., of the American Railway Association, New York, chairman of the meeting. He stated that frequently, owing to bumps which the car receives in transit, the material gets shot over until some of it is directly in the doorway. It then frequently becomes impossible to use skids in unloading until the doorway is cleared, which may take three or four men a period of three or four hours.

Reducing the height of the legs of skids was advocated by W. C. Brinton, president Terminal Engineering Co.,

New York. He referred particularly to a reproduction shown on the screen by one of the speakers, wherein skids of goods were stacked three high. The space between bottom of leg and the platform on which goods rested was, in this instance, about 25 per cent of the total height of skid and goods. If the handling equipment used were confined to power equipment with an over-hung end, the height of the skid could be reduced, Mr. Brinton said, from about 12 in. to 4 in., with consequent saving in storage space.

Undue Concentration of Load

Continuous runners on the bottom of the skid were referred to by this speaker as an aid, where material is stacked one skid above another. The legs concentrate the loads enormously on small bearing areas, compared with the way the runners would distribute those loads more equally.

Several examples of return of skids from user of material to the shipper were reported by Mr. Clark of the Clark Equipment Co., Buchanan, Mich. These instances were shipments in carload lots. They covered automobile brakes sent out by the Bendix Brake Co., South Bend, Ind., axles supplied by the Clark company on a specially designed skid, and automotive engines shipped by the Continental Motors Corporation, Muskegon, Mich.

Under-hung trucks with less than 2 in. clearance have been introduced this year by his company, said the speaker. He stated that all the leading manufacturers of power-driven hauling equipment maintain laboratories to study these problems of materials handling, and stand ready to send out experienced engineers to solve the handling problems of their prospective customers.

Tool Alloys Containing No Carbon

A RECENT announcement from the War Department that cutting tools containing molybdenum but no tungsten have been used at Watertown arsenal, revives interest in the theoretical studies of the iron-tungsten system published by W. P. Sykes before the American Institute of Mining and Metallurgical Engineers in 1926. These alloys contained less than 0.005 per cent carbon, and produced the equilibrium diagram illustrated.

It will be observed that tungsten in such an alloy has the property of lowering the temperature A_r , at which delta iron changes to gamma iron, and also raising the temperature A_r , at which gamma changes to alpha iron. These two transformations are eventually suppressed and no gamma iron is found in carbon-free alloys containing more than 7 per cent tungsten at any temperature. An alloy containing 7 to 9 per cent is permanently austenitic, and cannot be hardened or tempered by any heat treatment. Similar changes in the transformation temperature of pure iron are caused by other metals; permanently austenitic alloys are formed with high chromium, silicon, tin, vanadium, or molybdenum.

As shown by the diagram, the alloys with higher tungsten contain a second phase: the compound Fe_3W_2 , whose solubility decreases with the temperature (line BG), but which is precipitated throughout the metal only at a slow rate. To harden an alloy with 20 per cent tungsten, then, it is necessary to anneal or "age" it at a temperature somewhat below 1400 deg. C. for several hours or days. In the paper quoted Mr. Sykes gave the hardness of a carbon-free solid solution alloy containing 80 per cent iron and 20 per cent tungsten as 160 Brinell, and the same after aging as 330 Brinell.

In discussing this paper, Dr. Zay Jeffries said that carbon free iron-molybdenum alloys would develop even higher hardness on aging, quoting 530 Brinell for the hardness of

a 22 per cent molybdenum, 78 per cent iron alloy. "Alloys of the iron-tungsten and the iron-molybdenum systems, as hardened by aging, have been recently used in place of high-speed steel for certain purposes at the Cleveland Wire Division of General Electric Co. The results have been most satisfactory in that the useful life of these alloys is from 10 to 40 times that of high-speed steel," said Mr. Sykes, in the closing paragraphs of his paper.

Iron-Tungsten Equilibrium Diagram

What Magnetic Testing Reveals

More Knowledge of Uniformity and Continuity of Steel— Facts Which Other Methods of Test Bring Out— Limitations of All Tests

BY A. V. DE FOREST*

IT is a pleasant belief that there is a pot of gold buried beneath the end of every rainbow. Many have been disappointed when they set out to dig because, however definite appeared the location of the rainbow, when they finally reached the spot it had unaccountably moved further away.

If the gold digger happened to be a philosopher, he would study the nature of rainbows and discover that they are really circular and therefore have no end, and therefore that the story is not true at all. Thereafter he would refrain from studying the mechanical properties of steel, their chemical constituents, their microscopic appearance and particularly their magnetic characteristics. Each of these methods has been developed by workers who believed that complete knowledge of the mechanical behavior of steel could be reached with their tools; whereas it seems probable that the closer the search and the more accurate the method pursued, the further the rainbow recedes.

Early Claims for Chemical and Mechanical Tests

In the days when chemical analysis was first applied to steel all the peculiarities of that material were going to be explained by its ever varying proportions of carbon, manganese, silicon, phosphorus and sulphur. When Stead first examined steel through the microscope and discovered almost as many strange things as did Galileo with his telescope, a new explanation of mechanical properties developed. When the physical chemists started to teach Gibb's phase rule to metallographers, another series of facts in regard to steel was uncovered. The anatomists of the mechanical school, who sacrifice hecatombs of specimens to their testing machines, still impose their solution of all problems and in spite of the absurdity of specifying ultimate strength in cases where repeated impact is important or elongation when hardness is needed, they logically control the court of last resort on mechanical materials.

With all the methods of study, chemical, microscopic and mechanical, not to speak of the X-ray and magnetic analysis, our pot of gold seems as good as in hand—at least many of us on the scientific fringe are busy selling it. I take it our goal will be reached when we can predict the behavior of any individual piece of steel under definite conditions.

Success Depends on Mechanical Test Selected

The extent to which we are successful depends largely upon the mechanical test which we choose as a criterion of behavior. Take, for instance, a property such as the tensile strength of hot-rolled steel. Depending as it does on the average behavior of enormous numbers of separate grains, it is fairly well known for varying compositions and mechanical treatments. We can be reasonably sure that the strength of one specimen will be very closely equal to that

of other specimens cut from either side. In a test in which the properties of a much smaller volume of metal is involved, as, for instance, in a notched bar impact test, the variation would be more marked, and when we come to a really difficult case such as predicting the exact spot in a length of several feet of steel bar, of uniform section and treatment, which will break in the testing machine, we are at the present time almost helpless.

Assume Uniform Materials

Our methods of test are all based on the assumption that our materials are sufficiently uniform from one elementary volume to the next, so that the mechanical properties of a specimen destroyed in the testing machine may be assumed similar to all other parts of the same bar or even the same heat or grade of steel. The accuracy of this theory of vicarious test depends on the elementary unit of volume assumed. If it is large, the average results will be correct, but it would inspire greater confidence in the individual case if there were a non-destructive method of assuring the identical properties of the material and the test specimen representing it. It is this assurance which we unconsciously seek when we improve our steel making, our rolling mill practice, our heat treatment, and our methods of test, all devoted to the production of greater and ever greater uniformity.

The attempt to estimate this uniformity by a non-destructive test implies that whatever property is tested and found to be uniform will also indicate a sufficient uniformity of the desired mechanical properties.

Neither Magnetic nor Mechanical Tests Accurately Developed

In the case of the magnetic characteristics, there is much evidence that very close relationships exist between the two sets of phenomena. Unfortunately, however, neither magnetic nor mechanical tests have been developed to the point at which accurate comparisons can be made, involving the properties of small volumes. For instance, in a fatigue test the mechanical properties along a single plane will determine the life of the specimen. It is a simple matter to magnetically test the general properties of a considerable mass of metal and obtain good correspondence with other properties involving the whole volume, but in this case so far it is impossible to test magnetically the properties of a single plane.

We may, therefore, conclude that our test is a failure, whereas in reality we have translated a test involving a volume of metal in terms of a property involving only an area, and committed the same error which would occur in attempting to translate from the tensile strength of our specimen to the fatigue life. In both cases the average of a large number of tests will show good correspondence, but the life of the individual is still problematical. The disposition of the fatal plane is accidental and will average out in case of a large number in individuals. As in the case of life insurance tables—the mortality of a group may be

*Based on the author's comments when presenting his motion pictures of magnetic tests before the American Iron and Steel Institute in October, 1928. Mr. de Forest is research engineer American Chain Co., Bridgeport, Conn.

known with great accuracy, whereas the life of a single individual is largely a matter of chance.

The properties along this single plane or section may be covered by the term "continuity." This thought involves quite different conceptions from those involved in the term "uniformity," meaning uniformity of a property belonging to a large group of particles. The microscope has shown us that our steels are always more or less discontinuous and that the distribution of these sonims of other planes of weakness may have extremely serious consequences. Larger disturbances such as blow-holes, seams, segregations and piping become so apparent as to even affect the uniformity of the mass itself rather than merely the continuity from element to element of the material.

Testing Continuity Magnetically

Much work has been done on magnetic methods of testing continuity. In most of these cases we are really testing the uniformity of smaller and smaller volumes of metal in the expectation that the discontinuity on a single plane will be sufficiently marked to detect. As might be expected,

however, the smaller the area involved the greater becomes the difficulty in measurement as well as the variation from section to section both mechanically and magnetically. Neither side of the problem is complete. It is the latter difficulty which makes the development of magnetic methods so exceedingly slow and laborious in practice, although apparently so simple and straightforward in the laboratory.

Materials in use usually fail from impact, repeated impact, fatigue and wear. Failure from corrosion is obviously not included. Our mechanical methods of test for all of these, particularly fatigue, are inconceivably slow and crude; and in the case of wear there does not appear to be even the hope of a definition of this property, and yet the successful magnetic test must be capable of mechanical interpretation.

In spite of these difficulties magnetic methods frequently offer a simple method of assurance that a particular product is substantially uniform throughout its length, is without major discontinuities, and has the average mechanical properties of other specimens which have been studied to destruction.

Efficiency of Industrial Electric Furnace

AT a recent meeting of the fuel division of the American Society of Mechanical Engineers, held in Cleveland, James H. Herron of the James H. Herron Co., engineer, delivered a paper on "Industrial Furnace Efficiency, Economic Consideration." The paper dealt with the subject in a general way and discussed loss of heat in waste gases, regeneration, recuperation and certain other phases of the subject. The part of the paper dealing with electric furnaces was of special interest and is reproduced here.

Owing to the increased interest in the use of electricity in supplying heat for industrial purposes, this paper would not be complete without some reference to such furnaces for heat-treating and other industrial purposes, together with a consideration of their efficiencies.

Electric furnaces have been used for laboratory work for 20 years or more. The early furnaces were of the muffle type, the heating element being of platinum ribbon wound upon the muffle. With the introduction of the nickel-chromium alloys, either a nickel-chromium wire or ribbon was used as a substitute for the platinum.

Granular Carbon Resistances

The early industrial furnaces utilized the resistance offered by a quantity of granular carbon, usually contained in a refractory trough. These furnaces, while expensive both in construction cost and operation, became, due to their greater efficiency of operation, popular not only in the heat-treating of materials, but in the annealing of steel castings and the melting of non-ferrous metals.

Applying the laboratory form of resistor to the industrial furnace, and improving this resistor, has resulted in a comparatively low cost, high-efficiency, electric furnace which is rapidly succeeding the granular carbon resistor type, until at the present time the application of electric heating in industrial furnaces has become a matter of such general interest that, in all cases where current is available at a reasonable figure, such installation should be seriously considered.

Factors Affecting Economy of Operation

As in the fuel-fired furnace there are certain factors which affect the economy of operation of the electric furnace and therefore must be taken into consideration. These are as follows:

The loss of heat around door openings and loss due to

opening doors for charging and removal of materials to be heated.

The loss of heat through the sides, ends, top and bottom of the furnace with subsequent radiation from these surfaces.

The storage of unavailable heat.

The principal source of loss common to the fuel-fired furnace, namely, the loss of heat in the waste gases, is entirely eliminated in the electric furnace. In the electric furnace there is no air required for combustion, therefore there is no need of introducing into the furnace a large amount of air which must be heated to the temperature of the furnace and discharged at a high temperature.

In view of this one item, and the loss due to excess air used for combustion the cost of operation of the electric furnace compares very favorable with the fuel-fired furnace, and in some cases this cost is less. This is especially true where it is possible by use of an electric furnace to correct a low power factor. The saving in penalty may offset the cost of the required current.

Efficiencies Vary Between 60 and 80 Per Cent

The nicety of regulation of the electric furnace and the cleanliness of operation appeal to many and these are points decidedly in its favor. In considering the electric furnace, the efficiency will vary between 60 and 80 per cent, depending on the conditions of operation. The gross efficiency extending back through the generating station may be, and frequently is, as high as the fuel-fired furnace. The electric furnace has the same drawback as the fuel-fired furnace where the operation is intermittent, namely, the heat required to bring the furnace to the required temperature of operation known as unavailable heat.

In view of the progress made in such design it is therefore desirable for the prospective purchaser of an industrial furnace to give careful consideration to the electric furnace, since it may be the most economical for his particular application.

Merchants' Association Year Book

Classification of the membership of the Merchants' Association of New York is made in the Year Book for 1928. More than 6300 individuals, firms and corporations are listed, about 1000 of which have their plants elsewhere than in New York. The membership includes 186 concerns listed under the heading of Iron and Steel, Metals, Machinery. This is the eighth largest of the classifications.

Some Principles of Fixture Design

Fixtures for Machining Should Be Tied in with Gaging System—
Many Details Can Be Standardized

BY JOSEPH W. ROE*

JIGS and fixtures have been developed empirically and there is much less technical literature covering them than there is on power machinery and its utilization, or even on the very machines on which fixtures are used. Judging only from the literature available, one would gain no idea of their economic importance. However, the competitive technical advantage of one manufacturing plant over another will usually lie more in the better quality of its small tools, jigs, and fixtures than in differences between the types of machine tools in the respective plants.

The principles of good work-holder practice have grown up in the tool rooms and been handed down from man to man. Due to the multiplicity and variety of articles manufactured, there is a great diversity of fixtures and holding devices, so great as to preclude treatment of all their details in a paper such as this. But through all fixtures there run certain principles which have been developed gradually and come to be recognized as good practice. Many of these principles can be brought together, and it is the purpose of this paper to do this.

Before a set of fixtures can be designed the dimensions of the article to be manufactured must be definitely determined. This means that clearances and allowances must be made on certain dimensions for running, sliding, or driving fits. Furthermore the tolerances, or permissible deviations, must be established. These tolerances set the high and low limits for each dimension, which can not be exceeded without encroaching on the allowances necessary for proper functioning or destroying the interchangeability of the parts. In general the smaller the tolerances the greater the cost of production, consequently they should be as liberal as is consistent with the requirements of the product, and accuracy should be centered on those dimensions on which it is essential. The closeness of the tolerances governs the design and workmanship of the jig or fixture quite as much as the required rate of production.

When the drawings of the article to be manufactured have been checked and approved, a model should be made to within the tolerances given on the drawings. When this has been tested and pronounced satisfactory, any changes found necessary in allowances, tolerances, etc., should be incorporated into the drawings. The model and drawings can then be used as the basis for design of the jigs and fixtures. If during the building of the tools any discrepancy should develop between the model and the drawings, the approved working model should govern, and the drawings corrected to agree with it. When actual model parts are not available, wooden models of such parts as drop-forgings, with the location of the sprue and flash line painted on them, may be helpful.

Production and Gaging Operations Should Be Listed

In tooling up for the manufacture of a piece, an operation sheet should be prepared which includes every operation on the piece, both of production and of inspection or

gaging, showing them in a single list in the order of their application. The preparation of such a list focuses attention not only on the best sequence of production operations, but on the number of inspections needed, the dimensions they should cover, and the best points in the sequence at which they should occur. It also brings out the best grouping of operations and their reduction to the least possible number.

An authority consulted contributes the following as the procedure used by one large manufacturer having agencies throughout the world: "When a new machine has been developed to a stage where it functions satisfactorily the agencies are informed, and inquiries are instituted to determine the probable sales for the machine. During this inquiry period the machine is going through a process of refinement. Drop-forgings, stampings, grades of metal, hardness and finishes are being determined. When the approximate yearly sales have been determined manufacture starts by ordering all drop-forgings, blanking and bending dies, as these take the longest time to construct. Parts which are odd in shape or difficult to hold are assigned for tooling up, starting in the usual manner, with operation sheets which are provisional, as it is often necessary to revise the sequence of operations. Quality and interchangeability are the main requirements. While quantity will influence the type of fixtures it is possible to make cheaper tools at first with provision for the future if unexpected sales should develop."

The fixtures should be tied in with the system of gaging. The same points or surfaces should be used for locating the work in the fixtures and for reference points in the gages. Only by so doing are the gages a direct check on the fixtures. Some deviation is made, however, as when inspection gages are made to cover a sub-assembly of parts in order to insure that certain collective deviations do not exceed permissible tolerances. In some cases, also, as with pistons, it may be desirable to provide lugs especially for holding and driving during manufacture, which are removed in the last operation.

The same working points should be used on the two parts which go together in the manufactured output. This better insures interchangeability of the finished product.

In selecting the working points the functioning of the product and those dimensions which are most important to its operation should be given most careful thought.

Same Working Points Used for Many Operations and Gagings

It is of fundamental importance that, once settled upon, the same working or locating points be used for as many operations and gagings as possible. Preferably they should be permanent and remain in the piece when finished. If this cannot be done they should be retained as long as may be. If first one point and then another be used, an accumulation of errors creeps in which may exceed the tolerances. It is tempting at times to shift the locating point, as the fixture and gage might then be made more cheaply, but to do so is poor practice, and in the long run, poor economy. As an example of the above, in a set of fixtures recently built for a military rifle, 62 out of 67 operations on one piece, with their gagings, were located from one point.

It may be wise to shift the reference point, but it should be done only for good and sufficient reasons. For instance, the position of two holes A may be referred to a main reference point. The important requirement of a second hole B may be exact distance from holes A without regard to the

*Professor of industrial engineering, New York University. From a paper on "Jig and Fixture Practice," presented by Professor Roe before the American Society of Mechanical Engineers, at New York, Dec. 3. Formulas for determining the probable profit on proposed jigs and fixtures, for given costs and performance, also a feature of the paper, were given in THE IRON AGE of Dec. 13, page 1489.

original reference point. In such case both the fixture and the gage would very properly locate *B* with reference to the holes *A*.

If a multiple fixture is to be used, of either the reciprocating or indexing type, the question of the time required for removing and inserting pieces is of fundamental importance, as the clamping means must be so designed that the pieces can be handled in the time taken for the cut.

In general it is desirable to machine as many surfaces, or drill as many holes, as possible at one setting. This makes for accuracy, lessens tool expense, and cheapens production, but is subject to some limitations, as, for instance, the combination of a very large and very small hole in the same jig. It may be better to use two jigs on different sized machines. In some cases all the holes can be drilled in the same jig on one machine, and the larger holes then redrilled on another machine without a jig. This eliminates the cost of one jig.

In using a fixture equipped so that several tools perform the same operation on several pieces simultaneously, the parts from each tool should be kept separate. By so doing if the product from one tool is defective, the parts will not become mixed and the trouble is more easily located and remedied. However, the additional cost of handling the parts separately may sometimes more than offset the advantages of easily locating trouble.

How far it is desirable to make a fixture adaptable to various pieces and operations is a matter of judgment in each case. It usually does not pay except where the runs are very small. In general specialization is better than adaptability, because the latter, while it lessens tool expense, permits errors in settings and "monkeying" with the set-up.

Fixtures Should Be Interchangeable on Various Machines

Fixtures should be interchangeable on the various machine tools on which they can be used. Care in this particular allows greater flexibility in scheduling work through the shop. This principle calls for the standardization of slots on milling machines, machine tables, and of keys and keyways on the fixtures. So far as possible these should conform to the standards adopted by the American Engineering Standards Committee, and sponsored by such bodies as the A.S.M.E., the National Machine Tool Builders' Association, and others.

All jigs and fixtures should be clearly marked, preferably by stamping into the body where it can be done, the

operation, part number, etc., for which it is intended and any other information needed to identify it, also on all loose or bolted parts that may be separated from it. In very accurate fixtures stamping might be harmful. In such cases a brass plate should be screwed on, or the necessary marking may be etched.

All small parts, such as clamps, special wrenches, etc., should preferably be permanently attached to the jig or fixture to prevent their being mislaid or lost.

Despite the wide variety in jigs and fixtures many details may be standardized such as bushings, latches, handles, thumb-screws, etc. This lowers costs not only by making approach to quantity production possible in the tool room, but by making it possible to purchase them from firms specializing in such parts. It is amazing in going through large tool storages to see how many types of handles, etc., there are, differing from each other in unessential details in ways which run up costs without any compensating benefit.

The object of good fixtures is furthered by good work holders or racks for handling the work between operations. Throwing work promiscuously into tote boxes mars the finished surfaces and may cause misalignment in locating in succeeding operations.

Nine Things a Jig or Fixture Should Do

A jig or fixture should:

- (a) Locate the work quickly and positively
- (b) Preclude insertion of the work in any but the position correct for cutting
- (c) Provide rapid and positive clamping without undue effort
- (d) Allow no spring in the work, fixture, or machine table from either clamping or the pressure of the cutting tools
- (e) Allow no slipping, vibration, or chatter during the cut
- (f) Have ample clearance for chips, and be easily cleaned
- (g) Allow free access and egress for cutting oil or compounds
- (h) Be as light as is consistent with strength and rigidity, and easy to handle. In the long run the employer always pays for weariness, necessary and unnecessary. It is good design therefore to eliminate all unnecessary fatigue
- (i) Be safe for the operator. Production should be sacrificed, if necessary, rather than have a tool which is dangerous.

Houses a Works' Hospital, Library, Auditorium and Recreation Facilities

THE new service building of the Yale & Towne Mfg. Co., Stamford, Conn., which was recently dedicated, was provided for through a special bequest in the will of the late Henry R. Towne, for many years chairman of the board of the company. The building houses a works' hospital, dental clinic, the company's industrial relations bureau, a library and an auditorium seating 400. Bowling alley, pool room and other recreational facilities for employees of the company are included.

Very Large Normalizing Furnace, for Steel Sheets, Installed by Otis Steel Co.

Sheets Normalized on a Large Scale

Continuous Furnace for Wide Automobile Body Sheets— Heating and Cooling Stages Automatically Regulated

CONTINUOUS normalizing furnaces have been installed in a number of sheet mills making full finished sheets during the past few years. The object is to produce a finer grain structure and to improve the drawing qualities. A late type of normalizing furnace, and one of the largest ever built, was recently placed in operation by the Otis Steel Co., Cleveland. It is used to normalize extra deep-drawing automobile body sheets. It was built by the Surface Combustion Co., Toledo, Ohio.

This is a natural gas-fired furnace, 140 ft. long including loading and unloading tables, and has a heating chamber 100 ft. in length and a cooling chamber 40 ft. long. It is 84 in. wide or sufficient to handle sheets 80 in. in width. The furnace has a capacity of 140 tons in 24 hr., but it has been decided to augment this by replacing the present burners with larger ones increasing the heat, so that the sheets can be moved through the furnace at a faster rate. With the larger burners the capacity will be 200 tons in 24 hr.

The furnace is top and bottom-fired, having 60 burners at the top and 60 at the bottom in the heating zone. The burners are located on each side. The sheets are carried through the furnace on roller disks mounted on hollow water-cooled shafts that are insulated with high heat-resisting alloys. There are also burners on each side of the cooling zone for use when slow cooling is desired. Usually the sheets are made with a Rockwell hardness of 51 to 52. If quick cooling of the product is desired to increase the hardness and secure a fine grain, the cooling zone burners are not lighted, but if a lower hardness is desired the burners in the cooling zone are lighted to bring up the tem-

perature of that zone and thus to secure a less rapid cooling. A temperature of 1700 deg. to 1750 deg. Fahr. is maintained in the heating zone to assure a 1650 deg. temperature of the product when annealing low-carbon steel.

The temperature in the heating zone is controlled by four pyrometers. In addition to pyrometric temperature control, there are two thermometers, or radiation type pyrometers, located between the heating and cooling zone that record the temperature of the sheets as they leave the heating zone. The minimum temperature of the sheets to effect proper normalizing should be 1650 deg. Fahr. and the

thermometer readings indicate to the operator whether the sheets move through the furnace too rapidly or too slowly to maintain them at the proper temperature. The heating period depends on the gage of the sheets, light material moving through the furnace at a faster speed than the heavier gages. The temperature is controlled by regulating the speed of the roller disks.

Before the normalizing furnace was installed the extra deep drawing automobile body sheets were given two box annealing operations each of 30 hr. With the use of the normalizing furnace they are given only one box anneal after normalizing, the annealing period being 48 to 50 hr. The sequence of operations is normalizing, pickling, cold rolling, box annealing, then one pass through the cold rolls to relieve the surface strains and finally roller leveling.

Johns-Manville Corporation Buys Celite Products Co.

The Johns-Manville Corporation, 292 Madison Avenue, New York, manufacturer of roofing materials, has purchased the Celite Products Co., Los Angeles, maker of insulating materials. The executive and sales personnel of the Celite have been absorbed by the Johns-Manville organization.

Studies the Elements of Metal Cutting

Prof. O. W. Boston, head of the engineering shops of the University of Michigan, at Ann Arbor, is the author of a bulletin entitled "The Elements of Metal Cutting," published recently by the university's Department of Engineering Research. With the help of funds contributed by manufacturers in the Detroit area, Professor Boston has been making a

series of studies in the ancient art of cutting and forming metals.

Milling cutter action, drilling and straight line motion, such as that of the planer, have been the subject of Professor Boston's investigations thus far. Part of the research has been directed toward a study of the varying hardness of the cutting tools used, which include a plain, high carbon steel, high-speed steel and "Stellite." These studies will be given a wider scope and usefulness as soon as the funds available warrant greater expenditure.

The Federal Specifications Board, Washington, last week issued proposed specifications for aluminum-manganese tubes with a view to obtaining comments or suggestions as to changes which may be thought to be desirable. The specifications are the basis for purchases by the various departments and establishments of the Government.

Two Special Electric Welding Machines

TWO special welding machines, one a butt welder for use in the fabrication of automobile mufflers and the other a spot welder that makes two rows of spot welds in metal door assemblies simultaneously, are shown in the accompanying illustrations.

Automobile mufflers of various wall thicknesses are welded by the butt welding machine, which is the product of the Taylor-Winfield Corporation, Warren, Ohio, and is designated as the type B II special. The machine is motor operated. Timing of the current and upsetting of the weld are accomplished by adjustable cams. Uniformly accurate welds with minimum of labor expense is claimed. The particular machine illustrated welds the heads of the muffler to the body and the intake and outlet tubes to the head, making a completely electric-welded muffler.

The special spot welding machine, built by the Thomson Electric Weld-

The Thomson Welder, Which Makes Two Rows of Spot Welds Simultaneously, Is Shown Above

Automobile Mufflers Are Welded on the Taylor-Winfield Butt Welder at the Left

ing Co., Lynn, Mass., is made up of two standard welding machines mounted face to face on a sub-base that is adjustable to accommodate work of various widths between the electrodes. One driving motor operates both machines and the welds are made at the rate of 100 a minute.

Auxiliary Indexing Tables for P. & W. Jig Boreers

TWO new indexing tables, one of tilting rotary type, have been brought out by the Pratt & Whitney Co., Hartford, Conn., for use on its jig boring machines.

The tilting rotary table is used to advantage in boring holes that must be accurately spaced and accurately located at an angle, and is said to save considerable time and simplify many difficult jobs. It has a scraped

surface 12 in. in diameter and is designed for clamping to the regular table of the machine. The rotary part of this table is similar to the rotary table which has been a standard jig borer accessory for some time. The outer edge is graduated in degrees

for approximate indexing, which is accomplished by means of a large handwheel through a hardened and ground steel worm and large worm-wheel. The latter is integral with the cast-iron table and is cut by a special process to assure high accu-

The Tilting Rotary Table, at Right, Clamps to the Regular Table of the Jig Borer. The rotary indexing table at the left has 30-in. diameter working surface and is equipped with motor drive

racy. One revolution of the hand-wheel rotates the table 9 deg. Exact settings are made by a small slow-motion handwheel which connects through gearing to the same shaft as the large handwheel. The large dial on the small shaft is subdivided so that the table may be indexed accurately to 5 sec. Binders lock the table in position during the boring operation.

The table is hinged at one side and is raised and lowered by means of a crank handle through a worm and a gear segment. Graduations facilitate setting the table at any angle with the horizontal from 0 to 90 deg. and a vernier permits settings to 5 sec. Heavy binders are provided for

clamping the table securely in place.

The second table, also illustrated, is a rotary indexing table, which, with a working surface 30 in. in diameter, is much larger than previously supplied for the company's No. 2 jig borer. The outer edge is graduated in degrees for rough setting, finer settings being made by means of a handwheel and a vernier. An added feature is a small motor drive by means of which the table may be moved rapidly under power, thereby saving cranking by the operator. This motor drive can be operated in either direction and is controlled by a convenient lever. An adapter plate is used to mount the large rotary table on regular table of the jig borer.

Steel Roof Sheathing for Factory Use

LIGHT-WEIGHT steel sheathing for roofs is being put out by the Blaw-Knox Co., Pittsburgh, under the trade name of Blawsteel. It consists, as the

This sheathing when installed can be insulated against heat loss or penetration to any degree desired. It is said that $\frac{1}{2}$ in. of insulated material

Illustrating the Placing of Galvanized Steel Roof Sheathing, Its Insulation and Final Weatherproof Covering

illustration shows, of ribbed, galvanized steel sheets of 20, 22 and 24-gage material. This is designed to go over purlins spaced 3 ft. 10½ in., and will, it is said, carry a roof load of 65 lb. to the sq. ft. on this spacing, with a factor of safety of 4 and with so little deflection as not to affect plaster ceilings. Deflection of 3/16 in. is said to result from loading of 100 lb. to the sq. ft.

will satisfy usual requirements. Any type of built-up roofing can be applied on top of the insulation.

Longitudinal integral reinforcing ribs are pressed into the sheathing on 4-in. centers. These ribs are placed downward when the roof is built, and the sheets are fastened to the purlins by special anchors. Each course of sheets laps 3 in. over the preceding course, the ribs telescoping.

American Radiator to Merge With Standard Sanitary

Negotiations are under way for a merger of the American Radiator Co., 40 West Fortieth Street, New York, the country's largest maker of radiators and heating equipment, and the Standard Sanitary Mfg. Co., Bessemer Building, Pittsburgh, the leading producer of enameled iron sanitary ware and plumbing equipment. Merger plans call for an exchange of stock in the two companies, the details of which have not yet been worked out, and it is probable that

the organizations of the companies will remain unchanged.

The Radiator company operates more than 30 plants in the United States and subsidiaries in Canada and in a number of European countries. Its most recent acquisitions have been the Kewanee Boiler Co., Kewanee, Ill., and the American Blower Co., Detroit. The Standard Sanitary company operates eight plants in this country, and through its subsidiary, the Standard Sanitary Mfg. Co. of Canada, Ltd., two Canadian plants. Combined assets will amount to about \$500,000,000.

Hand-Operated Lubricating Device

THE Dot Lubricating Equipment Co., Division Carr Fastener Co., Cambridge, Mass., is offering the improved Nozzle-Fil lubricating equipment illustrated, which, in providing a "sealed journey from lubricant storage to bearing," permits the proper quantity of clean grease to be pressed into bearings to be lubricated. A barrel pump, portable filling tank and a hand gun comprise the equipment. The portable tank, which holds 25 lb. of grease, is filled in the lubricant

Grease in the Portable Tank Is Applied to Bearings by Means of the Hand Gun

storage room by means of the barrel pump. This tank is airtight and dust-proof and is shaped so that it may be carried without barking the shins of the greaser. In filling the hand gun the plunger in the gun is first released by loosening a locknut. After the nozzle is applied to the nipple on the portable tank, the gun is hand-pumped full of grease, which is accomplished in a few seconds.

The filled gun is then applied to Dot nipples or Dot-O-Matic pressure cups on the bearings of the machine to be lubricated and the handle of the gun twisted until the bearing flushes or the telltale at the top of the pressure cup reaches its extreme height.

The Climax Molybdenum Co., New York, has removed its Detroit office from 611 Donovan Building to 2807 Book Tower Building. W. P. Woodside is district representative.

Steel Demand Shows Seasonal Decline

Large Volume of Consumption Is Nevertheless Indicated—There Have Been Few Signs of Overproduction of Steel

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

STUDY of the potential steel requirements of the chief consuming industries shows that until November they continued at record levels for the post-war period. Such requirements amply support the recent high rate of steel ingot production. No overproduction is indicated. If anything, the output of steel until November was hardly up to the indicated current requirements.

In November, however, all indications showed a rather sharp decline in our composite demand line. The statistics are not complete as yet, but they indicate the sharpest drop that has occurred since December, 1926, at least. Fortunately the rate of steel production moderated in November also, so that the output is still in line with requirements. But the November decline, both in the activity of consuming industries and in steel production, suggests the possibility of some further recession.

November Recession Indicated

COMPOSITE steel demand showed a slight rise in October, due chiefly to gains in the railroad, construction and mining industries, and in exports. Drilling of oil wells and production of oil also increased. These factors were not quite offset by declines in automobile production, general manufacturing activity and farm purchasing power.

The situation changed considerably in November. In that month railroad freight traffic showed a decline that was fully up to the usual seasonal drop. Building and construction contracts were off rather sharply, falling back to about the same annual rate as in July. Automobile production reached the lowest annual rate since last January. The data are incomplete, but the factors mentioned are so important that the November final index will doubtless approximate that shown in the first chart.

It should be noted that October had about 4 per cent extra working time this year. This probably makes the October index a little too high, which in turn emphasizes unduly the decline shown for November. Probably the chart would give a more correct picture if the composite demand line were portrayed as rounding off in October, with a more moderate decline in November—somewhat similar to

the movement shown in the steel production curve.

Conditions in Particular Lines

As to the outlook for the next month or two, we find the *railroads* showing improvement. Net operating income in October made a good gain. Freight traffic increased considerably in that month and, considering the season, the November traffic was well sustained, promising a good gross for the month. If expenditures continue as low as in recent months, net income should make a good showing. It must be remembered, however, that the decline in expenses is partly the result of economy in buying. Purchases of rails have been below last year and, while demand for equipment has improved somewhat, it is none too good. In short, the outlook is for some improvement, but only a fair volume of railroad buying.

Building contracts are still large, being sustained by the construction of roads and subways, which, while they require considerable steel, are not indicative of the ordinary commercial building trend. In fact, building permits continue their downward trend and in November were about 16 per cent under a year ago. Contemplated new construction increased sharply, but this was largely due to a \$100,000,000 project for roads in Iowa. On the whole, the building outlook suggests further declines, which should affect certain kinds of pipe, nails, sanitary enameled ware, etc.

Automobile production fell off more than usual for the season last month, and the future seems uncertain. The industry is set for a heavy production schedule in the early part of 1929. High activity is probable. Many, however, look for increased severity of competition and less favorable conditions after the usual spring spurt.

General manufacturing activity (aside from automobile and iron and steel) has shown a decline. No large recession, however, is indicated, though it seems probable that the peak has been passed. Farm purchasing power appears to be not much different from a year ago. The value of the chief crops is about 6 per cent under last year, but dairy products show a large increase.

We conclude that the demand for steel has reached a peak and that a

little recession is likely. It may well be that a short spurt will occur early next year, but this would probably be followed by a decline. The trend of the P-V line has been downward for two months.

Freight Cars More Freely Bought

A CONSIDERABLE increase has occurred in the purchase of railroad freight cars and a good-sized volume of inquiries is reported. Briefly, the facts as to equipment buying are as follows: In November, 6100 freight cars were ordered, which is the largest November business since 1925. The freight car surplus of the railroads is small in comparison with a year ago. Freight traffic in November was heavier than in any recent year except 1926. A moderate improvement in freight car buying is thus indicated. It is noteworthy that employment in railroad equipment repair shops in the East increased sharply in November and was above a year ago.

There has, however, been little change in the locomotive business. Only 41 steam locomotives were ordered by domestic railroads in November and no upward trend is evident. Total shipments of steam and electric locomotives declined in November, and unfilled orders were lower. This indicates a decrease in new orders. The business during the last four months has been at the lowest level since 1921-1922.

Moderate Recession in Ingot Production

AVERAGE daily production of steel ingots (adjusted to eliminate seasonal changes), after rounding off in October, declined in November. Our index for the month is 114.6. This means that steel production was 14.6 per cent above normal. The index in October was 118.8 and a year ago 85.1. The year's peak of 119.2 was reached in September. This is beginning to look like a cyclical peak. Steel production has recently been far above a normal level, and declines in the P-V line and in the composite demand line indicate further moderate recession. At least, the seasonal increase that usually occurs between

Steel Production in November Was 14.6 Per Cent Above Normal Requirements. Prices held well but little further advance is probable. Unfilled orders showed a decline instead of the usual November rise

Improved Finished Steel Prices (in Particular, Sheets and Bars) May Hold for Some Time. Scrap prices appear to be ready for further decline and pig iron should hold present levels for a month or two

Steel Ingot Production (Adjusted) Showed a Decline in November. Composite demand showed a slight rise in October, but November indicates a falling off

Railroad Car Orders Are Improving, While Locomotive Orders Continue Low. But the surplus of cars is so large that there is no indication of immediate need for heavy purchases

January and March is likely to be less than usual.

The unfilled orders of the Steel Corporation declined 78,000 tons in November and were 700,000 tons lower than last March. They were only 220,000 tons above a year ago. Except for last year, this is the lowest November figure in many years. Usually there is an increase in November.

The average price of finished steel in November showed a small increase. It was 93.8 per cent of the average for 1923-1927, compared with 97.2 per cent in November, 1926. The situation in some respects resembles that found in the latter part of 1926. It does not seem that much further advance in steel prices is probable.

Overproduction of pig iron is in sight. The November average daily output was 115.5 per cent of normal, compared with steel production at 114.6. This is the first time that pig iron production has been in excess of a normal relationship with steel production since December a year ago. At that time both were at low levels, while now both are above normal. Pig iron production is at a level which in the past has always brought price weakness in a short time.

Pig iron prices, however, averaged higher in November, THE IRON AGE index for the month being \$18.49, which is 86.4 per cent of the average for 1923-1927, against 84 per cent in October and 82.3 per cent a year ago.

Ohio Employment High in Manufacturing

Industrial employment in Ohio during November showed the first decline since January, according to the current bulletin of the Bureau of Business Research of Ohio State University. The decrease, however, was caused entirely by the falling off of 25 per cent in construction employment, whereas general manufacturing employment increased slightly. The number of industrial wage earners last month was 12 per cent greater than in November, 1927, and average employment during the first 11 months of 1928 was 1 per cent greater than during the same period last year.

In the iron and steel group, the November employment index of 102 was the same as in October, but was 17 per cent higher than in November, 1927. Of the 171 reporting companies, 75 showed increases from October, 85 decreases and 11 no change. Employment in the machinery industries of Ohio continued its upward climb during November and reached its highest point since December, 1926. The November index of 113 was 3 per cent greater than the October index and 11 per cent greater than the November, 1927, index. The improvement in the machine tool group is notable, the November index of 120 being 4 per cent above the October index and 48 per cent above the November, 1927, index. In the material handling and power ma-

The situation bears some resemblance to that found in January, 1926. A decline in prices within the next month or two is indicated.

Prices Not Far Out of Line

AS to the general price structure in the iron and steel industry, it may be said that sheets are low, while nails, bars, billets and pig iron are in fairly good adjustment. If anything, the steel items are a little high in comparison with pig iron, though not much. Heavy melting steel scrap is high, especially in comparison with pig iron. The average of finished steel prices appears to be about right in comparison with the general level of commodity prices.

We might reason that sheets and nails will hold their recent gains, that scrap (following the current tightness at Pittsburgh) will decline further, and that the other chief items, including pig iron, should hold about stable. Our pig iron barometers, however, indicate that the prices of this commodity will soon reach a peak and are likely to decline. The clearest indication given by the statistics is that there will be an early end to the advance in the pig iron market. The scrap barometer, also, has not yet indicated any sustained recovery.

Perhaps this tangle of factors suggests what the market writers call "irregular stability" for a time—certainly, irregularity.

chinery group, the November index of 107 reflected no change from October, but was 25 per cent above that in the corresponding month last year. In all cases an average month of 1923 represents 100.

Would Extend Powers of Tariff Commission

A subcommittee of the National Conference on Tariff Adjustment has been appointed to draw up a plan to "take politics out of the tariff" by making the Tariff Commission a more practical and helpful adjunct of Congress. This body of men will confer with members of the House Ways and Means Committee, President Coolidge and President-elect Hoover and others specifically interested. The names of the members of the subcommittee have been announced by John E. Edgerton, president of the National Association of Manufacturers, under whose auspices the National Conference on Tariff Adjustment was brought together. Among them are James A. Campbell, president Youngstown Sheet & Tube Co., Youngstown; J. W. Hook, president Geometric Tool Co., Bridgeport, Conn., and W. W. Nichols, assistant to president, Allis-Chalmers Mfg. Co., Milwaukee, Wis.

In explaining the purposes of the subcommittee Mr. Edgerton states that the national conference favors extending the powers of the Tariff Commission so that it will be more

immediately operative in meeting contingencies, making it a semi-judicial and non-partisan body. Adequate appropriations for research and fact-finding would be necessary, and actual powers of rate adjustment (not rate making) would make it a more practical working adjunct of Congress. It is not intended, he explained, to ask Congress to abrogate or relinquish any of its constitutional prerogatives. The plan would still leave Congress with the establishment of tariff policies and the fixing of the general standard of rates, but would give the Tariff Commission the power to adjust those rates in the light of commercial pressures of the moment.

Greater Iron Production in Canada

Pig iron production in Canada for November is reported by the Dominion Bureau of Statistics at 95,426 gross tons. Except for the August output of 97,879 tons, this was the largest monthly figure for the year. It exceeded the October total of 93,186 tons by 2½ per cent, and was 2½ times as great as the 37,989 tons of November, 1927.

For the first 11 months the production of 934,085 tons is 43 per cent greater than the 646,500 tons of the corresponding period of last year, and is almost as far ahead of the first 11 months of 1926 (683,532 tons). There were eight furnaces in blast Nov. 30, compared with seven a month earlier.

Production of ingots and steel castings in November was 108,463 gross tons; this was ½ per cent lower than the 108,987 tons of October, but was 34 per cent in excess of the 80,730 tons of November, 1927. Included in the current figures were 104,501 tons of ingots and 3962 tons of castings.

For the first 11 months, ingots and castings amounted to 1,137,160 tons; this showed an increase of 40 per cent over the 811,390 tons for the first 11 months last year, and of 58 per cent over the 718,395 tons in the first 11 months of 1926. This year's output included 1,097,977 tons of ingots and 39,183 tons of castings.

Ferroalloys produced in November amounted to 4532 tons, compared with 2127 tons in October. For the first 11 months, however, there has been a decline of 24 per cent from 52,161 tons last year to 40,073 tons this year.

W. J. Rainey, Inc., has acquired from the Hillman Coal & Coke Co. approximately 3000 acres of coal, adjoining the Clyde Coal Co. property which was bought by the Rainey interests earlier in the year. The latest purchase is for the purpose of consolidating the Clyde properties, which were separated by the Hillman lands. It is understood in the trade that coal from the Clyde mines will be shipped by river to the Davison Coke & Iron Co., which is building a 35-oven by-product coking plant there.

Quiet Rules in European Markets

Approach of Holidays Noticed—Better Shipbuilding Orders in England—Far East Stagnant

(By Cablegram)

LONDON, ENGLAND, Dec. 17.

PIG iron demand is quieting as the holiday season approaches, but most Cleveland furnaces now are quoting with January as the earliest delivery to date. Stocks have been reduced, during the past three months, by 60,000 tons, and an increase in the rate of output is anticipated in the new year.

Hematite is firm. Foreign ore markets are firm, but business is practically idle.

Finished iron and steel demand has improved, largely on account of recent increases in shipbuilding orders, which, on the North-East Coast, have totaled 500,000 tons during the past two months. Hence steel makers are looking for an increased demand for heavy material.

General export sales are still quiet. Vickers, Ltd., Sheffield, Sir William G. Armstrong, Whitworth & Co., Newcastle-on-Tyne, and Cammell, Laird & Co., Sheffield, have combined as to certain departments and have formed the English Steel Corporation.

November exports of iron and steel amounted to 399,400 gross tons. Of this amount 37,800 tons was pig iron, of which only 100 tons was consigned to the United States.

Tin plate markets are quiet, but inquiry is improving. Makers are well sold for the early part of next year and there is talk of price ad-

vances. Current output is about 65 per cent of capacity, owing to the fact that several mills are idle, working off the agreed stoppage period of a few weeks.

Galvanized sheets are moderately active, in small parcels, but black sheets are quiet.

On the Continent of Europe

Continental iron and steel markets are quiet on both sides of the channel and prices are tending to easier levels.

British users of semi-finished material are concentrating on British steel, as Continental forward deliveries are subjected to too great delays. Export demand, for traders in England, is poor.

German November production of pig iron was only 267,400 metric tons, a decrease of 74 per cent. Blast furnaces operating at Nov. 30 were 48.

South Africa is to ask for 40 new locomotives, costing about £300,000 (\$1,455,000).

Far Eastern Merchants Not Buying Chinese Await New Tariff and Japanese Expect Lifting of Gold Embargo—Test on Steel Marking Postponed

NEW YORK, Dec. 18.—Export trade with Far Eastern markets continues small. Chinese merchants are evidently delaying all but necessary purchases of material until the new Chinese tariff has become effective and Japanese buyers are awaiting the expected end of the Government's gold embargo. Inquiry from China for wire shorts and second hand material, such as plate cuttings and bar crops, continues fairly active, but only occasional transactions are reported with sellers here. American wire mills and exporters to the Far East have evidently lost interest in selling wire

shorts, even at the Chinese offering prices of today, which are sometimes as much as \$50 per ton, c.i.f. Chinese port. The tonnages sold are small and the profits as a rule negligible. Some business in plate cuttings is reported when Chinese merchants are willing to pay \$30 per ton, or more, c.i.f. Shanghai.

In addition to rail inquiries from Japan, mills are bidding on the usual quarterly tin plate requirements of the Nippon Oil Co. While the present inquiry is for only 35,000 base boxes of oil can sizes, it is suggested by exporters to Japan that this ton-

Importers of Continental steel in New York are taking some small business in certain special products, such as furring channels and chromium alloys of steel. Occasional transactions are reported in imported shapes and bars, but in most cases purchases are from importers' stocks or represent old orders on which delivery from Continental mills has been delayed. Prices are slightly lower than a few weeks ago, but shapes still range from 1.83c. to 1.85c. per lb., duty paid, New York, and bars are about 2c. per lb., duty paid, New York.

Customs Court hearings on the marking of foreign steel with the country of origin have been postponed to the middle of January from Dec. 18 and 19, when the first cases of domestic steel companies against importers of steel were scheduled. Importers are understood to be prepared to aid the Treasury Department in defending its ruling on marking and are also reported considering appearing at the hearings on the tariff beginning next month in Washington.

British Exports Up, While Imports Decline

WASHINGTON, Dec. 15.—Exports of iron and steel products from the United Kingdom increased to 399,447 gross tons in November, from 377,390 tons in October, while imports dropped to 232,767 tons from 261,404 tons, according to a cablegram received by the iron and steel division, Department of Commerce, from William L. Cooper, commercial attaché, London. Production of both pig iron and steel ingots and castings showed a gain. Pig iron output rose to 544,400 tons from 543,600 tons, and ingots and castings increased to 762,500 tons from 756,000 tons. At the end of November 135 blast furnaces were lighted, against 136 at the end of October, while the number of open-hearth furnaces in operation had increased to 287 from 264.

Increases in exports in November were reflected in 14 of the 22 classes, losses being made in the remaining eight. The principal gains were in rails, which increased 16,568 tons to

40,243 tons; wrought tubes, pipes and fittings, which increased 7143 tons to 27,388 tons; "other manufactures of iron and steel," which increased 6092 tons to 37,741 tons; galvanized sheets, which increased 2831 tons to 73,862 tons, and railroad material, other than rails, which increased 2748 tons to 14,103 tons.

Of the 19 classes in the import trade, 13 reflected losses. The decrease of ingots and semi-finished steel, amounting to 16,167 tons, accounted for more than one-half of the total decline of 28,637 tons.

German Rail Rates Reduced on Exports

HAMBURG, GERMANY, Nov. 23.—Railroad freight rates on iron and steel and non-ferrous metals for export are to be reduced by the German Railroad Directory. The present rates, which are lower than the domestic charges, are to be reduced 1.10 m. (26c.) per 100 km. As the average distance to seaboard from the Rhenish-Westphalian plants is 280 km., this amounts to a cut of about 3 m. (72c.) per ton. The reduction will be about 6 m. (\$1.43) per ton on shipments from works in Upper Silesia. The rate revision will not apply to shipments to Belgian or Dutch ports.

Austrian Home Demand Continues Active

VIENNA, AUSTRIA, Nov. 29.—The lockout at steel mills in Germany resulted in a slight increase in demand for steel products from Austrian sellers, but only a limited tonnage was available. Domestic business is active, and there is a fair volume of export tonnage. The latest report of the Alpine Montan A.G. shows a decided increase in the number of unfilled orders on its books, particularly in bars and structural material.

In October steel mills operated at practically full capacity, but pig iron output was only about 75 per cent. Automobile builders are active, and there is a good tonnage of business in special grades of steel and wire. Output of iron ore in the second quarter

of 1928 was 475,369 metric tons, compared with 424,955 tons in the first quarter. Export business has been good in recent months, particularly in iron and steel bars. Sheet and tube exports were considerably smaller than imports of those products.

So-called "rationalization" in industry is proceeding, and since 1926 improvements in production methods have resulted in a reduction of about 40,000, from a total of about 1,000,000 employed in the Austrian metal industry. While wages have been advanced, wages as an item of cost in production have declined. In the automobile industry wages have risen about 6 per cent, but the wage cost per car has gone down 4 per cent.

German Exports and Imports Show Drop

WASHINGTON, Dec. 14.—Exports and imports of iron and steel in the German international trade showed declines in October as compared with September, while production of pig iron and steel ingots showed increases, according to a cablegram received by the Department of Commerce from Commercial Attaché Fayette W. Allport, Berlin.

October exports totaled 345,439 metric tons as against 407,563 tons in September, a decrease of 62,024 tons or 15.3 per cent and imports declined to 148,561 tons as compared to 156,596 tons, a drop of 5.1 per cent. Pig iron output was 1,025,895 tons as against 985,413 tons and steel ingot production was 1,306,338 tons as compared to 1,189,521 tons.

German Reparations Shipments Large in October

HAMBURG, GERMANY, Dec. 1.—The total value of steel and machinery shipments on reparations account in the first 10 months of this year was 101,000,000 m. (\$24,068,300). There has been a fairly steady increase in such shipments during the year, and the total for October was considerably larger than for September. October shipments included 5,000,000 m. (\$1,191,500) of industrial machinery, 1,700,000 m. (\$405,110) of electrical equipment, 4,700,000 m. (\$1,120,010) of steel products, 1,100,000 m. (\$262,130) of non-ferrous metals and 13,300,000 m. (\$3,169,390) of hardware.

German Steel Tariff Reduction Possible

HAMBURG, GERMANY, Dec. 1.—Reduction in the duties on certain iron and steel items appears probable in a new tariff to be considered by the Reichstag early next year. The proposed schedule lowers the duties on about 130 items, including certain iron and steel products and machinery. These reductions in duty would be applied only on imports from countries with which Germany has a commercial treaty, such as the United States.

Controlling Fuel in Steel Plants

Oil and Gas Fuel for Open-Hearths Before British Fuel Institute—Systematic Scheme for Rolling Mills—Pre-mixing Burners for Hot-Blast Stoves

(Special Correspondence)

LONDON, ENGLAND, Nov. 30.—The autumn meeting of the (British) Institute of Fuels was held in London late in November, and one of the sessions was devoted to a discussion of the value of scientific control in the fuel-consuming operations in the steel industry.

An American Engineer's Opinion

Martin J. Conway, fuel engineer to the Lukens Steel Co., Coatesville, Pa., stated that fuel oil to be used economically must be correctly atomized, which means primarily that the oil at the point of atomization, which is usually the burner, must have the right viscosity, and as viscosity is a function of temperature the fuel oil system should be so designed that the proper oil temperature can be maintained at all rates of flow.

The success of fuel-oil used on open-hearth furnaces depends upon constant pressure and constant temperature. Constant pressure can be maintained by the use of a pressure unloading valve or pressure regulating valve placed at some point on the delivery line beyond the most distant furnace in the shop where it will discharge the surplus oil into the return line.

Constant temperature can be maintained by thermostatic control of the oil leaving the heater and the steam entering the heater, this heater being preferably situated on the discharge side of the pump, utilizing the low pressure exhaust from the pump turbines with a high pressure connection for starting up or emergency purposes, should the spare pumping unit be electrically driven. The temperature of the oil required to produce the best viscosity for atomization is usually not more than 160 deg. Fahr. at the burner for the heaviest liquid fuel.

It is unnecessary to heat the liquid fuel beyond this point for several reasons, one being the unnecessary waste of steam because the drop in viscosity is very small compared with the increased temperature.

Some of the advantages to be obtained by the use of liquid fuel were given by Mr. Conway as follows:

"It does not deteriorate or lose its fuel value in storage. It is easy to store and easy to convey to the point of consumption. It burns with a very high flame temperature, but on account of ready control of flame direction it permits greater refractory life and simpler furnace design. Checkers remain clean longer with fuel oil than with producer gas.

"On account of the smaller volume of waste gases to be handled, stack capacity requirements are reduced 35 per cent when compared with producer gas.

"Due to the fact that liquid fuel can be metered, individual furnace performance can be readily measured, thereby allowing the executive to compare the efficiency of his furnace operators."

Constant High-Quality Gas Necessary

"Fuel Control in Open-Hearth Practice" was discussed by J. Lloyd Bentley of Robert Heath & Low Moor, Ltd., who stated that the first essential to secure economy of fuel was constant high quality of producer gas composition. Another essential, he said, was that the air supply should be controlled so as to secure a high flame temperature and the least oxidizing atmosphere. Control of gas quality and pressure to the furnace, control of air supply through the valves, and control of draft, were all essentials for economical working of the furnace.

Mr. Bentley advocated continuous recording by suitable graphs, allowing operators to note the results of control side by side with results obtained in furnace operation of output and of fuel consumption. He urged that the fuel engineer must gain the confidence of managers and men of the particular units under investigation, and said that personality and tact were important essentials.

Fuel Control in Forge and Rolling Mill Practice

The subject of fuel control was dealt with by H. C. Armstrong of John Brown & Co., Ltd., who stated that the most important duty of the fuel officer was to watch that no more fuel was burnt than was necessary to perform the required heating operations successfully, and to satisfy the temperature requirements of the forge master. The first step was to recognize the necessity of measuring the amount of fuel used over a definite period; a considerable saving has invariably followed the adoption of a practice of making a systematic weekly return from each shop.

The weekly data required for systematic control are not great, and need not consist of more than:

- (a) Fuel used.
- (b) Material heated or produced.
- (c) Furnace hours during which the heating continues.

From these are calculated:

- (d) Fuel per unit weight (ton) of output.
- (e) Output per furnace hour.
- (f) Fuel per furnace hour.

It is on the last of these items, i.e., the fuel burnt per furnace hour, that Mr. Armstrong has built up his methods. Fuel consumption figures are frequently taken as impossible of improvement without thought to the true significance of the manner in which they are presented. The almost universal habit of speaking of fuel per ton is entirely misleading unless output figures are given at the same time. Low fuel per ton figures are glibly quoted to illustrate the "high" efficiency of some particular furnace without mention being made of the highly favorable load conditions that have contributed to the result. Similarly, when discussing the matter with the shop manager, it is usual for him, not unnaturally, to speak of a figure which represents the best practice of his furnaces. Any other result is brushed aside as not typical, and as being obtained under unsatisfactory conditions, notwithstanding the fact that those conditions may be the most prevalent.

Fuel Control in Hot Blast Stoves

J. B. Fortune of the New Cransley Iron & Steel Co., Ltd., said that, to improve the combustion and the efficiency of any battery of hot blast stoves, scientific control should proceed along the following lines:

The gas supply should first of all be rendered fit for satisfactory burning by some method of gas cleaning. The existing burning arrangements should be brought up to their highest efficiency by checking the combustion from flue gas analyses, and reducing the excess air as much as possible. If the working conditions are such that flue gas tests indicate a fair efficiency, then the provision of continuously recording CO₂ meters on all the stoves is recommended.

To obtain the best results in combustion control, a good type of pre-mixing burner should be installed and operated in conjunction with CO₂ recorders. Very variable pressure conditions in the gas supply should be leveled out by means of an automatic regulator. The utmost refinement in combustion control necessitates the supply of combustion air under pressure, automatic control to maintain a constant ratio of gas and air, an efficient pre-mixing burner, and continual checks upon combustion by the use of CO₂ and CO continuous recorders coupled up to the stove connection to the chimney flue.

Milwaukee Company Buys Eller Mfg. Co.

The Milwaukee Corrugated Co., Milwaukee, maker of sheet metal building products, has purchased the Eller Mfg. Co., Canton, Ohio, maker of corrugated steel awnings and other products, and will take over its management on Jan. 1. The Eller company will continue to serve its customers without change in personnel, but its manufacturing activities will be extended and machinery added for new products. Later the company will make metal lath, corner bead, channels, road strips, stove pipe, furnace pipe and all types of conductor, furnace and stove pipe elbows. The plant will be used largely to serve Eastern and foreign customers of the Milwaukee company.

Republic Brass Corporation Combines Six Companies

Organization of the Republic Brass Corporation, combining six large brass manufacturing companies, with assets of \$39,000,000, has been practically completed with the ratification of the consolidation by stockholders of the constituent companies. As mentioned in THE IRON AGE of Dec. 6, page 1474, the new corporation will acquire the assets, business and good will of the Rome Brass & Copper Co., Rome, N. Y.; the Michigan Copper & Brass Co. and the Higgins Brass & Mfg. Co., Detroit; the Taunton-New Bedford Copper Co., Taunton and New Bedford, Mass.; the Dallas Brass & Copper Co., Chicago, and the Baltimore sheet mill of the General Cable Corporation, Baltimore. Through stock ownership in the Michigan Brass & Copper Co., the American Smelting & Refining Co. will have a substantial common stock holding in the new corporation.

Barton Haselton, president Rome Brass & Copper Co., will be chairman of the board of the new corporation, and George H. Allen, president Michigan Copper & Brass Co., will be president. Directors will include Walter C. Baylies, chairman of the executive committee Edison Electric Illuminating Co., Boston; Francis H. Brownell, chairman of the finance committee American Smelting & Refining Co.; Walter P. Chrysler, president Chrysler Corporation; H. T. Dyett, vice-president General Cable Corporation; Samuel L. Fuller of Kissel, Kinnicutt & Co., New York investment bankers; C. S. Mott, vice-president General Motors Corporation; W. H. Peirce, vice-president American Smelting & Refining Co.; Walter Robbins, president General Cable Corporation; Alfred P. Sloan, Jr., president General Motors Corporation, and Roger W. Straus, vice-president American Smelting & Refining Co.

The capitalization of the new corporation will consist of \$10,000,000 first mortgage 6 per cent bonds, \$10,000,000 7 per cent preferred stock,

250,000 shares of no par value Class A stock and approximately 510,000 shares of no par value common stock. Kissel, Kinnicutt & Co. will soon make a public stock offering.

Rolling Mill to Be Built at Calgary

WASHINGTON, Dec. 18.—The Manitoba Bridge & Iron Works, Ltd., Winnipeg, which operates a rolling mill at Selkirk, Man., is planning to erect a plant at Calgary, according to a report received by the Department of Commerce from Trade Commissioner J. Bartlett Richards, Winnipeg. The new unit, which will produce light structural steel, bars, rods, plates and castings, will employ about 160 men and when completed will represent an initial outlay of approximately \$400,000. The greater part of the equipment will be taken from two rolling mills, one at Medicine Hat and the other at Redcliff, Alta., which the company purchased last summer and which are about to be dismantled. The new mill will constitute the second steel company in Calgary, the Riverside Iron Works, Ltd., being in operation there, producing shapes, iron castings, machinery, etc.

Inland Company Organizes Limestone Subsidiary

The Inland Steel Co., Chicago, has organized a new corporation for the production of chemical and metallurgical limestone to be known as the Inland Lime & Stone Co. The project will be located in the eastern end of the northern peninsula of Michigan, about 25 miles east of Manistique. The business of the Manistique Lime & Stone Co. will be taken over and continued, and its stockholders will retain an interest in the new company. During the past year diamond drilling has been conducted on the lands owned or held under option by the Manistique company and George J. Nicholson, and a large tonnage of high calcium limestone has been proved up. In developing the project a large quarry will be opened, a railroad will be constructed to Lake Michigan, and a crushing and screening plant with suitable harbor and dock facilities will be constructed in the vicinity of Seul Choix Point, making the limestone available for transportation in lake vessels. Stone will be produced not only for use in the steel industry, but also for chemical purposes such as the paper industry, in which the Manistique company has already built up a substantial business.

That phase of the project will continue to be managed by George J. Nicholson and his assistants, Gordon Hughes and Walter Moon. The opening of the new quarry and the construction and operation of the new plant will be in charge of A. J. Cayia, for the past four years superintendent

of the Wakefield Mine of the M. A. Hanna Co. on the Gogebic Range in Michigan. The directors of the new company will be P. D. Block, L. E. Block, David P. Thompson, Clarence B. Randall, George J. Nicholson, Gordon Hughes and I. N. Bushong. The officers will be: David P. Thompson, president; Clarence B. Randall, assistant to the president; George J. Nicholson, vice-president; and W. D. Truesdale, secretary-treasurer. It is expected that the new plant will be put into operation during the latter part of 1930.

Standard Steel Building Manufacturers Organize

The Standard Steel Building Institute, composed of manufacturers of standard steel buildings, has been organized for cooperative trade extension. At a meeting held in the Stevens Hotel, Chicago, Dec. 6, the constitution and by-laws were adopted and the following officers were elected: C. I. Auten, Truscon Steel Co., Youngstown, president; W. A. Knapp, Butler Mfg. Co., Kansas City, Mo., vice-president; H. O. Davidson, Blaw-Knox Co., Pittsburgh, Pa., secretary-treasurer.

Representatives were present also from the Stefcu Steel Co., Michigan City, Ind.; Maryland Metal Building Co., Baltimore, and International Derrick & Equipment Co., Columbus, Ohio.

It will be the aim of the institute to acquaint American industry with the unusual merits of standard steel buildings, such as low first cost, speed of erection, durability, portability, ease of alteration, fire safeness and lightning protection.

Chattanooga Shop Builds Large Steel Drum

Combustion Engineering Corporation reports that its affiliated company, the Hedges-Walsh-Weidner Co., Chattanooga, Tenn., recently shipped to the Gulf States Creosoting Co. an unusually large steel drum for pressure creosoting. The shell is 140 ft. long, 8 ft. in diameter and has a plate thickness of 1 in. This is believed to be the largest steel drum ever shipped as a completely assembled unit. It weighs between 150 and 200 tons and required five flat cars for shipment.

Another shipment recently made from this plant was a car tank for nitric acid, said to be the first nitric acid car tank built in this country. This tank is 6 ft. 1½ in. inside diameter and 31 ft. 9 in. long. The top two-thirds of the shell is made of 5/16-in. steel, the bottom is made of 7/16-in steel and the heads are made of 9/16-in. steel. This tank has a capacity of 7000 gal. and is first of seven stainless steel tanks to be built for the E. I. du Pont de Nemours & Co.

Trade Practice Rules Adopted at Chicago

Woodworking Manufacturers Draw Up Regulations in Conference with Trade Commission Representatives

AT a trade practice conference held Dec. 12 at the Hotel Sherman, Chicago, a set of 15 rules was adopted, for submission to the Federal Trade Commission, by representatives of manufacturers who make approximately 90 per cent of the woodworking machinery produced in this country and who comprise about half the number of companies in that industry. The meeting was sponsored by the Association of Manufacturers of Wood Working Machinery.

G. S. Ferguson, commissioner, and M. M. Flannery, director of trade practice conferences of the Federal Trade Commission, presided. The rules adopted are as follows:

1. Inducing of employees of competitors to violate contracts, or enticing away of employees of competitors in such numbers or under such circumstances as to constitute a conversion and an appropriation of the value created at the expense of the said competitor, is unfair trade practice.

2. The willful interference by any person, firm or corporation by any means or device whatsoever, with any existing contract or firm order between a seller and a purchaser of any product of the woodworking machinery manufacturing industry, such interference being for the purpose or with the effect of dissipating, destroying or appropriating in whole or in part the patronage or business of another engaged in such industry, is unfair trade practice.

3. Manifestly exaggerated or false statements by a manufacturer, agent, dealer or seller concerning the size, weight, working range, design, material, condition or performance of any of his own machines or parts thereof is unfair trade practice.

4. Manifestly exaggerated or false statements by a manufacturer, agent, dealer or seller concerning the size, weight, working range, design, material, condition or performance of any competitor's machine or part thereof, or the circulation of false statements or false reports of a disparaging nature concerning the personnel or the financial standing of competitors is unfair trade practice.

5. The payment or allowance to any customer of secret rebates, refunds, credits or unearned discounts, whether in the form of money or otherwise, is unfair trade practice.

6. The payment or promising to pay to any employee of a customer or prospective customer of a commission or consideration of any character is unfair trade practice.

7. The granting of either a selling commission or dealer's discount to any concern or individual other than an established woodworking machinery dealer or salesman is unfair trade practice.

8. As much confusion has arisen in the industry, resulting in many instances in price discrimination, as a result of members of the industry selling their product on a basis of free delivery in some instances and in others selling the same f.o.b. factory, we agree that all selling shall be based on delivery f.o.b. point of manufacture and that when delivery at any other point is necessary the proper transportation and handling

charges shall be added to the f.o.b. factory price; and that any variation from such practice shall be deemed to be an unfair method of competition.

9. Any discrimination in price between purchasers of the same class, (not including discrimination in price on account of the difference in grade, quality or quantity of the product sold, or which makes only due allowances for difference in cost of selling and transportation), or discrimination in price in the same or different communities not made in good faith to meet competition, where the effect of such discrimination may be to substantially lessen competition or tend to create a monopoly, is an unfair trade practice: *Provided*, however, that nothing in this resolution shall be construed to prevent the use, when published, as defined in Rule 10, of a special quantity price applicable to a definite quantity of goods which are placed in one order and are shipped as promptly as possible.

10. The members of the woodworking machinery industry, both manufacturers and dealers, while maintaining absolute freedom in the issuance of price schedules from time to time, in conformity with the established trade practices, do adopt as a cardinal principle that there shall be no discrimination as between purchasers of their product, and that all published prices as issued by any member shall set forth plainly the price and terms and conditions, and that such published prices shall truly represent the sales price in all cases where the goods sold and conditions and terms are set forth in the member's price schedule, and any deviation from the principle expressed herein shall be deemed an unfair trade practice.

11. The industry recognizes the fact that where the customer for a new machine is also disposing of an old machine, there are two distinct transactions involved, one being the sale of the new machine and the other being the purchase of the old machine. Therefore, the industry agrees that these two transactions shall be held distinct.

The industry further agrees that no price in excess of its fair market value shall be paid or allowed for on any used machine thus offered for sale by the prospective customer for a new machine.

12. The sale or offering for sale of any product of the woodworking machinery industry under any form of guarantee to the purchaser or prospective purchaser against either advance or protection against the decline in the price of said product is an unfair trade practice.

13. The industry hereby records its approval of the practice of distributing and circulating, to the entire industry, published current price lists, including all notices of advance or decline in prices made by any individual manufacturer, either by the manufacturer or by the association or group he may be identified with.

14. The industry hereby records its approval of the practice of making the terms of sale a part of all established price schedules, and the failure on the part of manufacturers or manufacturers' agents or dealers to strictly adhere to such terms of sale, or to willfully fail to enforce the collection under such, shall be termed an unfair trade practice.

15. The sale or offer for sale of a new machine as a repossessed or rebuilt ma-

chine, with accompanying price discrimination to favored buyers, is an unfair trade practice.

These rules will be studied as to their legality by the Federal Trade Commission. Those that are acceptable will be printed and distributed by the association to all manufacturers in the industry with the request that they adopt the practices recommended.

Lakewood and Jaeger Companies to Merge

A merger of the Jaeger Machine Co., Columbus, Ohio, and the Lakewood Engineering Co., Lakewood, a Cleveland suburb, has been approved by directors of the two companies and will be submitted to stockholders for their approval shortly. This merger will bring together two of the large manufacturers of concrete mixing, handling and placing machinery. The Jaeger company makes concrete and plaster mixers of various types and the Lakewood Engineering Co., in addition to the manufacture of concrete mixing and handling machinery for use in road construction, also makes industrial trucks and trailers. Each plant will continue to have its sales and distribution departments.

Under the merger plans the assets of the Lakewood company will be transferred to the Jaeger company and the stockholders of the former company will receive two shares of Jaeger stock for each share of Lakewood stock after there has first been declared to Jaeger stockholders a cash dividend equivalent to approximately \$5 per share.

Midwest Power Conference to Convene in February

The fourth Midwest Power Engineering Conference will be held at the Palmer House, Chicago, Feb. 12 to 15. Power plant substructure problems will be discussed on Feb. 12. On Feb. 13 there will be sessions on metallurgical and chemical problems and electrical engineering problems. The former will be featured by a paper on "Metallurgy of Material Used in Power Equipment," by A. E. White, University of Michigan, Ann Arbor, Mich., and a paper on "Researches in Corrosion" by K. H. Logan, electrical engineer Bureau of Standards, Washington. In a session on Feb. 14 devoted to power plant operation. H. H. Moss, Linde Air Products Co., New York, will deliver a paper on "Welding in Power Plant Construction and Maintenance," and P. J. Gaudy, Sessions Engineering Co., Chicago, will discuss "Coordination of Industrial Plant and Station Power." Other sessions will take up power plant economics and problems in heating, ventilating and refrigeration will have attention.

Building Promises to Increase Says C. N. Fitts

Charles N. Fitts, New England Structural Co., Boston, the newly-elected president of the American Institute of Steel Construction, Inc., on Dec. 13 met with the engineering staff of the steel fabricators' organization. Among those present were the district engineers of the institute, to whose work Mr. Fitts especially addressed himself. In the course of his remarks, Mr. Fitts said:

"Structural steel sales during 1928 were generally larger than last year. The money market has somewhat deterred bonded investments during the past month, but we find that only a temporary check on building. Orders now coming out indicate that our business promises to go forward at a fair increase."

Merger of New York Dry Dock Companies

The United Dry Docks Corporation, New York, has been organized to take over and consolidate the properties of the Morse Dry Dock & Repair Co., Brooklyn; the New York Harbor Dry Dock Co., Tompkinsville, S. I.; James Shewan & Sons, Brooklyn; Staten Island Shipbuilding Co., Mariners Harbor, S. I.; the Theodore A. Crane Sons Co., Brooklyn; and the W. & A. Fletcher Co., Hoboken, N. J. Officers of the present companies will be identified with the new organization, which plans expansion programs at the different plants. The merger may include two or three other shipyards in the New York territory and will probably be headed by E. P. Morse, president of the Morse company.

Productive Efficiency of Industry Increases

WASHINGTON, Dec. 14.—Between 1925 and 1927 there was a further increase in production per worker in both manufacturing and agricultural industry, said the annual report of E. Dana Durand, chief of the Division of Statistical Research, Department of Commerce, in discussing progress in national efficiency. In a table it was shown that as compared with the annual average for the period 1898 to 1900 the average for the two calendar years 1926 and 1927 showed an increase of approximately 55 per cent in the output of farm products, 280 per cent in the output of minerals (an exceptionally large figure owing particularly to the immense expansion in petroleum production), about 180 per cent in factory output, and over 200 per cent in the volume of rail transportation.

These figures compare with an addition of about 55 per cent to the population of the country. It is obvious, the report said, that there is produced for each person in the population a far greater volume of goods and ser-

vices than at the beginning of the century, which means, of course, a great advance in living standards. In the case of every one of these four major branches of industry the increase in output since 1898 and 1900 has been far greater than that in the number of workers. In agriculture, manufactures, and railroads the product of goods or services per worker engaged has increased from 50 to 60 per cent.

Automobile Companies Are Increasing Production

Steadily increasing production by manufacturers introducing new models, with a generally high rate of output in practically all car and truck factories, gives promise of bringing the December total in excess of 300,000, according to *Automotive Industries*. The holiday season probably will have less effect on factory operations than in any year in the industry's history. Demand for deliveries of new cars has fallen to the low point of the year, so much so that Ford dealers in many parts of the country are able to make immediate deliveries, though still carrying large banks of orders for deliveries after Jan. 1. Much of the selling in all lines during December is for delivery after Jan. 1, resulting in some accumulation of new car stocks.

Would Study Plans of War Needs

WASHINGTON, Dec. 14.—Discussing reserve stocks of war material, Assistant Secretary of War Charles B. Robbins, in the Department's annual report, says the preparation of a definite plan to supply information as to what are the requirements in mobilization of material is the greatest need now confronting the army. The plan would be a specific forecast of the effort required adequately to defend the nation from invasion during the period of industrial transposition. With executive approval of such a plan and legislative sympathy in such a plan, it will be possible for the first time, it is stated, to submit for the attention of Congress a definite program for peace-time accumulation and maintenance of essential stocks.

Assistant Secretary Robbins repeated a recommendation that a board be appointed to determine war-time munition needs. If the appointment of such a board is not deemed advisable, he said, it is strongly recommended that the War Department and the Navy Department jointly prepare for the approval of the President and presentation to Congress a specific project for defence of the country from attack by any enemy or coalition of enemies which might arise.

Such a project, it was declared, should take into account the country's geographical isolation, the initial resistance of the navy, the present size of the army, the strength of the nation's man power and the stage of

industrial development. It should give consideration to the time needed for training troops, the initial rate of production of munitions, the period required for industry to come into mass production for war and the necessary war reserves of finished articles. The Assistant Secretary of War also again recommends passage of the bill providing for educational orders to be placed with industries during peace-time.

November British Iron and Steel Output Higher

LONDON, ENGLAND, Dec. 14 (*By Cable*).—November pig iron production was 544,400 gross tons and that of steel ingots and castings was 762,500 tons, both larger than in October.

A comparison of the November output with October and with the monthly rate for the first nine months of this year, as well as with the rates for previous years, is as follows, in gross tons:

	Pig Iron, Tons	Steel Ingots and Castings, Tons
1913—Av. monthly...	855,000	638,600
1920—Av. monthly...	669,500	755,600
1922—Av. monthly...	408,500	490,100
1923—Av. monthly...	620,000	706,800
1924—Av. monthly...	609,900	685,100
1925—Av. monthly...	519,700	616,400
1926—Av. monthly...	203,500	296,700
1927—Av. monthly...	607,800	758,200
1928—To Oct. 1, monthly....	552,800	702,700
1928—October.....	543,600	756,000
1928—November....	544,400	762,500

To Dec. 1, the monthly rate of pig iron output has been 551,200 tons and that of steel 713,000 tons—both lower than in 1927.

Packard Company Has Made Large Plant Additions

The Packard Motor Car Co., Detroit, the factory program of which now amounts to nearly \$10,000,000 a year for new machinery and equipment and the rebuilding of many departments, recently included a new aluminum foundry, a large addition to the stamping factory and the rebuilding of the power plant. Building No. 21, which is one of the 79 structures comprising the Packard plant, was completed recently in 60 days. It is three stories high, 190 x 382 ft. and embraces a glass covered court 60 x 320 ft. This building, which brought the floor space of the Packard plant up to 3,200,000 sq. ft., was built to carry several additional floors when needed and contractors are now adding two floors, which, when completed, will afford nearly 300,000 sq. ft. of floor space.

The new \$1,000,000 plant of the General Motors Corporation at Regina, Saskatchewan, which will employ about 800 men, was opened this week. It is expected that bodies for two General Motors cars will be produced in this plant, the primary purpose of which is the assembling of cars destined for western Canada.

Youngstown-Ohio River Rail Link Favored

Interstate Commerce Commission Admits Need for Lower Rates on Coal to Youngstown District— Allows Further Hearings

WASHINGTON, Dec. 18.—Iron and steel manufacturers in the Youngstown district were favored in a decision announced today by the Interstate Commerce Commission in passing upon the application of the Pittsburgh, Lisbon & Western Railroad for authority to construct two branches which would give Youngstown rail connection with the Ohio River.

The commission said that public convenience and necessity require rail transportation between the Ohio River and the Youngstown district in connection with transportation on the river and connecting waterways. However, the record was held open and further hearing was assigned to secure evidence bearing upon the practicability of providing such rail transportation over existing lines.

This indicates that the trunk lines, the Pennsylvania and Pittsburgh & Lake Erie railroads, will have to afford lower rates by water and rail on coal from the Pittsburgh and Connellsville districts to the Youngstown district or new construction will be permitted. Thus, regardless of whether the P. L. & W. finally is allowed to build the lines, it is evident that Youngstown will be given lower rates on incoming shipments of coal. Reduced rates by the Trunk Line carriers might be arranged by establishing rail-and-water connection with the Youngstown district by the Pennsylvania water connection at Rochester, Pa., and by the Pittsburgh & Lake Erie water connection at Monaca, Pa.

Possible Cut of 70c. a Ton on Coal Rate

The present all-rail rate on coal to the Youngstown district from the Pittsburgh district is \$1.34 a ton, while from the Connellsville district it is \$1.43 a ton. It was estimated that the proposed water-and-rail rates through use of the proposed P., L. & W. lines would be a minimum of 50c. a ton and a maximum of 75c. a ton, with a possible average of 60c. The Youngstown district consumes approximately 8,000,000 tons of bituminous coal annually, and based on a possible cut of 70c. a ton in the rate on coal, it is estimated that the Youngstown iron and steel industry would save about \$5,600,000 annually. This would reflect itself in reduced cost of making pig iron and steel. Moreover, connection with the Ohio River would give the Youngstown district a rail-and-water outlet for shipment of steel to the South and Southwest by way of the Ohio and Mississippi rivers, cheapening transportation costs and placing Youngstown in a better position to compete with the Pittsburgh, Wheeling and

Steubenville districts, which now have access to water shipments.

Railroads Must Clarify Position

"Authority to construct the proposed new line," the commission's report said, "will not be granted until we are fully satisfied that a use of the existing rail routes between the Ohio River and the Youngstown district, which will produce substantially the results proposed by the applicant (P., L. & W. Railroad), is impracticable." It was added that the Pittsburgh & Lake Erie and the Pennsylvania will be expected to make their position in regard to the proposed use of their lines entirely clear so that the commission may be fully advised in the matter.

Objects to Operation by Coal Company

The P., L. & W. Railroad is owned by the Pittsburgh Coal Co., which would ship much of the tonnage of coal over the proposed lines. The commission said that the practical control and operation of a common carrier by its principal shipper is a condition to be avoided. It also pointed out that it is proposed that the transfer facilities at the Ohio River shall be under control of either the Lisbon Railroad or of the Youngstown Sheet & Tube Co. The commission added that, should the new construction be permitted, consideration will be given to the imposition of a condition that the P., L. & W. shall not be under the control, direct or indirect, of the Pittsburgh Coal Co., "or any other industry or industries, and the further condition that terminal facilities shall be provided on the Ohio River which shall not be under such control and shall be open to the free use of all shippers."

Says Prosperity Factors Are Still Present

WASHINGTON, Dec. 18.—All of the basic factors which have contributed to the healthy state of business during recent months, among which may be mentioned more efficient production and distribution with a smaller accumulation of stock and the well-sustained confidence in the stability of existing conditions, are still present with no visible signs of receding, according to Secretary of Commerce Whiting. It was pointed out that a slight recession in the output of some commodities may be expected as the time for inventory taking nears. Available statistics were declared to show that trade and industry generally are in record volume with retail trade showing an expansion over recent months due largely to the holiday demands. The recent fluctua-

tions in the stock markets, Mr. Whiting said, are now generally believed to have strengthened business by bringing stock prices nearer to their intrinsic value.

"Any forecast of future conditions, of course, can only be based upon the forces in motion," it was stated. "Most of the basic industries for which statistics are available have been active throughout the entire year. Automobile production, estimating for the month of December, will doubtless exceed the previous high record of 1926, when 4,299,000 passenger cars and trucks were produced; steel production during the year promises to increase over 1927, when the output totaled 43,041,000 tons; available statistics indicate that the output of copper will advance over last year, when mine production amounted to 829,978 short tons.

"Exports of merchandise during the first 11 months of 1928, according to preliminary figures, were valued at \$4,655,459,000, being higher than for any corresponding period since 1920 and \$197,724,000 in excess of exports for the corresponding period of 1927. This larger volume of export trade has contributed greatly to our domestic activity.

"A further note of stability is added by the fact that exports of merchandise for October and November of this year, \$550,866,000 and \$546,000,000 (preliminary figures), respectively, were larger than for any previous month since January, 1921, when exports were valued at \$654,300,000."

High Shipments of Fabricated Structural Steel

WASHINGTON, Dec. 18.—Orders for fabricated structural steel in November totaled 187,331 tons, or 65 per cent of the 289,975-ton capacity of the 195 reporting firms, according to the Department of Commerce. Orders reported in October were 192,854 tons, or 64 per cent of the capacity of the 215 reporting firms. Computed orders in November aggregated 243,750 tons, against 240,000 tons in October, while shipments were 288,750 tons, or 77 per cent of capacity, compared with 322,500 tons, or 86 per cent of capacity.

Except for October, the computed tonnage of new orders was the smallest since last April. Shipments, however, were above the average of the previous 10 months, having been exceeded, this year, only by October and August. November orders were 3 per cent above last year; shipments were 17 per cent higher than in 1927.

Computed orders for the 11 months of the current year totaled 3,041,250 tons, or 74 per cent of capacity, against 2,805,000 tons, or 68 per cent of capacity, for the corresponding period of last year. Computed shipments were 2,902,500 tons, or 70 per cent of capacity, against 2,655,000 tons, or 64 per cent of capacity, for the corresponding period of last year.

Fabricated Structural Steel

Awards Decline to 17,200 Tons—New Projects Call for 23,250 Tons

INCLUDING 8000 tons for two car ferries for the Pere Marquette Railroad, awards reported during the week amounted only to 17,200 tons, one of the lowest totals of the year. Outstanding among new projects, which will require 23,250 tons, were a bank building at Minneapolis, calling for 6000 tons, a section of the New York subway, which will require 4200 tons, and grade elimination work in connection with the new Cleveland station, calling for 4000 tons. Awards follow:

NEW YORK, 800 tons, apartment building in West Seventy-second Street, to Taylor-Fichter Steel Construction Co.
STATE OF NEW YORK, 125 tons, highway bridge, to American Bridge Co.
LEHIGH VALLEY RAILROAD, 400 tons, building work at Jersey City, to Bethlehem Steel Co.
CENTRAL RAILROAD OF NEW JERSEY, 125 tons, bridge at Bartley, N. J., to Phoenix Bridge Co.
DOVER, N. J., 1550 tons, Picatinny Arsenal buildings, to Bethlehem Fabricators, Inc.
WARNER, N. J., 300 tons, power house for American Cyanamid Co., to American Fabricators Steel Co., Philadelphia.
ATLANTIC CITY, N. J., 250 tons, Park Lane Hotel, to McClintic-Marshall Co.
CHARLESTON, W. VA., 200 tons, building for Libby-Owens Plate Glass Co., to Pittsburgh Bridge & Iron Co.
RALEIGH, N. C., 500 tons, bank building, to Dietrich Brothers.
DETROIT, 422 tons, *Detroit Times* Building, to McClintic-Marshall Co.
BUFFALO, 270 tons, platform for New York Central depot, to Lackawanna Steel Construction Co.
LOUISVILLE & NASHVILLE RAILROAD, 200 tons, bridge work, to American Bridge Co.
SOUTH BEND, IND., 350 tons, building for Building and Loan Association, to Duffin Iron Co., Chicago.
PRAIRIE DU CHIEN, WIS., 1800 tons, toll bridge across Mississippi River, to Austin Bridge Co., Austin, Tex.
SUPERIOR, WIS., 700 tons, coal bridge, to American Bridge Co.
CHICAGO, 190 tons, field houses for Northwest Park Board, to Duffin Iron Co., local.
GREEN BAY, WIS., 400 tons, hotel, to Vulcan Iron Works, Fond du Lac.
PERE MARQUETTE RAILROAD, 8000 tons, two ferry boats, to Manitowoc Shipbuilding Co.
STATE OF WASHINGTON, 700 tons, power house for Stone & Webster, Inc., to Pacific Car & Foundry Co.; reported last week to unnamed fabricator.
SEATTLE, 250 tons plates, outlet pipes for Diablo Dam, to Willamette Iron & Steel Works.
SEATTLE, 129 tons plates, standpipe for Lake Youngs, to Chicago Bridge & Iron Works.
SACRAMENTO, CAL., 170 tons, crossing at Benham, to unnamed fabricator.
TIBURON, CAL., 100 tons, shop building for Northwestern Pacific, to Judson-Pacific Co.
OAKLAND, CAL., 150 tons, packing plant for Kings County Packing Co., to Herick Iron Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 1000 tons, Massachusetts General Hospital unit.
NEW BRITAIN, CONN., 500 tons, high school.

NEW YORK, 4200 tons, subway section 5, route 106; bids Dec. 21.
NEW YORK, 1000 tons, Schemerhorn Laboratory for Columbia University at 118th Street and Amsterdam Avenue.
WARNER, N. J., 200 tons, building for American Cyanamid Co.
DETROIT, 350 tons, building for Motor Product Corporation; bids in.
WINDSOR, ONT., 2500 tons, Canadian approach to Detroit tunnel.
CLEVELAND, 4000 tons, grade elimination work in connection with new union station.
CINCINNATI, 600 tons, library at University of Cincinnati.
FORT WAYNE, IND., 200 tons, municipal power house.
CHICAGO, 1500 tons, MacChesney & Rubens-Wolbach Building; Holabird & Roche, architects.
MINNEAPOLIS, 6000 tons, bank building; Graham, Anderson, Probst & White, Chicago, architects.
KANSAS CITY SOUTHERN, 1200 tons, bridges.

Form \$150,000,000 Merger in Airplane Industry

The United Aircraft & Transport Co. has been organized as a holding company, which will acquire all the stock of the Pratt & Whitney Aircraft Corporation, Hartford, Conn.; the Chance Vought Corporation, Long Island City, N. Y., and the Boeing Airplane & Transport Corporation, Seattle, Wash. As one of the largest consolidations yet undertaken in the airplane industry, the new company will have a market value of approximately \$150,000,000 and will embrace the three major lines of the industry, namely, engine manufacture, plane construction and transportation.

More than half the common stock of the Pratt & Whitney company, which manufactures Wasp and Hornet air-cooled airplane motors, is owned by the Niles-Bement-Pond Co., New York, and stockholders in that company will receive two and one-eighth shares in the new corporation for each share of Niles-Bement-Pond. The Chance Vought Corporation manufactures Corsair observation planes, and its entire common stock will be acquired by exchange of stock in the new company. The preferred and common stock of the Boeing company, which is engaged in airplane manufacture and commercial air transportation on the Pacific Coast, will be exchanged share for share for the securities in the new corporation. The United Aircraft & Transport Co. will have an authorized

capitalization of 1,000,000 shares of 6 per cent preferred stock of \$50 par value and 2,500,000 shares of common stock.

All the subsidiary companies will be continued with their present managements and personnel, and with no changes in policy. William E. Boeing, president of the company bearing his name, will be chairman of the board of the new company; Frederick B. Rentschler, president of Pratt & Whitney, president; Chance Vought, vice-president, and Charles W. Deeds, secretary and treasurer. The directorate will include Philip G. Johnson, president of Boeing Air Transport, Inc., and the Boeing Airplane Co.; Charles F. Kettering, vice-president General Motors Corporation; Kenneth R. Kingsbury, president Standard Oil Co. of California; Charles K. Knickerbocker, vice-president Griffen Wheel Co.; William B. Mayo, chief engineer Ford Motor Co.; George J. Mead, vice-president and chief engineer Pratt & Whitney company, and Orville W. Tupper, secretary and treasurer Boeing Airplane & Transport Corporation.

Carnegie Bust Unveiled in Pan-American Union

WASHINGTON, Dec. 18.—A bronze bust of Andrew Carnegie, the gift of Mrs. Carnegie, was unveiled last Saturday in the Hall of the Americas of the Pan-American Union in the presence of the delegates of the American republics to the International Conference of American States on Conciliation and Arbitration, the diplomatic representatives of the republics of Latin America, members of the Cabinet and other high Government officials. The presentation address was made by Dr. Henry S. Pritchett, president of the Carnegie Foundation for the Advancement of Teaching. The bust was unveiled by the nine-year old granddaughter of Mr. Carnegie, Louise W. Miller, and was accepted on behalf of the governing board of the union by Frank B. Kellogg, Secretary of State, and chairman of the board. Mr. Carnegie contributed \$850,000 toward erection of the building, which is the permanent home for the organization representing the international union of the American republics.

Los Angeles Fabricators To Be Merged

The Consolidated Steel Corporation, Los Angeles, has been organized to take over and consolidate the Llewellyn Iron Works, the Baker Iron Works and the Union Iron Works, all of that city. All these companies are fabricators of structural steel buildings and other products and the Llewellyn and Baker organizations also manufacture elevators. The new company will be capitalized at \$6,000,000 and plans extensions and improvements to the three plants to coordinate manufacturing facilities.

This Issue in Brief

To reduce production costs, prepare an operation sheet before tooling up. This sheet should include every operation, both of production and inspection or gaging. Show them on a *single list*, in proper order. Thus attention is focused on the best sequence, on the number of inspections needed, on the best grouping of operations, and on their reduction to the least possible number.—Page 1575.

* * *

Prices forecast by Dr. Haney. Early end to advance in pig iron market is indicated by statistics, says economist. Scrap barometer has not yet shown any sustained recovery. Finished steel prices appear to be about right in comparison with general level of commodity prices.—Page 1582.

* * *

Original cost of anti-friction bearings may well be less than that of plain bearings, says engineer. Having no expensive scraping-in labor, installation cost of the former is considerably lower.—Page 1563.

* * *

Carburizing costs are reduced and possibility of distortion is lessened by "single treating." Fine-grained steels may be treated considerably above the minimum temperature required for complete hardening, without coarsening. Thus both case and core may be satisfactorily refined by a single heating and quenching operation.—Page 1561.

* * *

Will tin plate find a competitor in aluminum-coated sheets? The latter is lighter than tin plate, according to Germans, who are reported to be planning for quantity output. Although aluminum is only half the price of tin, production costs may be higher, as the aluminum and the steel sheets must be sweated together.—Page 1555.

Oil-film bearing is the best type of plain bearing, says manufacturer. Though frictional coefficient is high at the moment of starting, later on it becomes much lower and approaches its best at the upper limits of speed. This type of bearing has great overload capacity.—Page 1566.

* * *

For economical manufacture, install a budget system. The three main tools—men, money and materials—must be coordinated. The budget enables an executive to measure the success of his efforts. It shows where improvements can be made.—Page 1567.

* * *

High uniformity of gage of rolled products is obtained by use of anti-friction bearings in rolling mills. Less adjustment of rolls is required and heat in the roll necks is considerably reduced, to a more or less fixed quantity.—Page 1565.

* * *

Magnetic testing offers a simple method of assurance that a particular product is substantially uniform throughout its length, says metallurgist, that it is without major discontinuities and that it has the average mechanical properties of other specimens which have been studied to destruction.—Page 1573.

* * *

Fixtures should be tied in with system of gaging. The same points or surfaces should be used for locating the work in the fixtures and for reference points in the gages. Only by so doing are the gages a direct check on the fixtures.—Page 1575.

* * *

Superior machining quality of coarse-grained steel is proved by production results of several large users who worked steels of known grain size, says metallurgist.—Page 1559.

If six or more men do your material-handling, you can cut your handling costs by using skid equipment. Cost will be reduced one-third, says truck manufacturer.—Page 1571.

* * *

Shock resistance of steel that is fine-grained after carburizing test is higher than coarse-grained, according to Izod impact test. But values for yield point, ultimate strength and elongation appear to be unaffected by grain size in the carburizing test, says metallurgist.—Page 1560.

* * *

"Fool proof" in heat treatment is a characteristic of fine-grained steels, says metallurgist. They are not so sensitive and therefore do not have to be worked within narrow limits of temperature and time.—Page 1561.

* * *

For high-temperature, high-pressure work, chrome-tungsten steel is well suited, investigators declare. A proportional limit of 100,000 lb. per sq. in. was secured, with little ductility, at 1000 deg. Fahr., after various heat treatments.—Page 1616.

* * *

Profits by successful methods of others and avoids errors discovered elsewhere, by utilizing business papers. Farm equipment manufacturer and head of United States Chamber of Commerce finds trade papers of great value in efficient operation of his business.—Page 1562.

* * *

Where lift trucks must operate in narrow aisles, arrange the skids in herringbone fashion. Then the truck need turn only a 45-deg. angle instead of 90 deg., and considerably narrower aisles can be utilized without inconvenience.—Page 1571.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Steel Far Outstrips Pig Iron

ITS surprisingly high production of ingots has already had much attention in comment on the various contributions of 1928 to the steel industry. Noteworthy in that connection is the unprecedented "spread" between pig iron production this year and steel ingot production. Estimating pig iron at 38,000,000 tons and steel ingots at 50,000,000 tons, we have steel exceeding pig iron by no less than 12,000,000 tons. In the past ten years the difference has ranged between 2,680,000 tons in 1919 and 7,564,000 tons in 1926. In 1927 it was about 7,200,000 tons.

All along it has been known that steel companies were making a much larger use of scrap in the production of open-hearth steel, but it will no doubt be a surprise even to those who have closely watched this development to find that the pig iron-ingot gap in 1928 has been nearly 4,500,000 tons more than in any other year.

It has been said for some years that pig iron is no longer a barometer of the steel trade, so large a place has scrap taken in steel-making, with the remarkable expansion of the open-hearth. Concurrently the increasing use of scrap in the blast furnace has destroyed the parallelism that was once fairly uniform between pig iron production and Lake Superior iron ore production, Lake ores being 80 to 85 per cent of the country's production of iron ore. Without now elaborating the subject, which has several points of interest to producers of iron ore and pig iron and to dealers in scrap, we append figures for 1928 and the year 1913, which is commonly taken in making comparisons with pre-war conditions. They represent production of Lake iron ore, and the country's output of pig iron and steel ingots in the two years:

	Lake Ore	Pig Iron	Steel Ingots
	Gross Tons	Gross Tons	Gross Tons
1913	52,377,362	30,966,152	30,280,130
1928	54,500,000	38,000,000	50,000,000

In 1913 steel ingot production was just overhauling pig iron production, which it passed in 1915. The figures are an impressive comment on much that was written 25 years ago of a doubling of pig iron production every ten years, and of an impending scarcity of Lake Superior ores in view of a ten-year doubling of demand for ore, to keep up with pig iron. With little more than a 2,000,000-ton gain in Lake ore output, there is a pig iron increase equivalent to 14,000,000 tons of ore, and an ingot increase equivalent to more than 22,000,000 tons of pig iron. The steel industry has been drawing increasingly on its above-ground stores of raw material, as each year sends a larger

tonnage to the discard. This and producers' "own" scrap now figure in our steel-making economy to an extent never dreamed of by the prophets of an approaching famine in Lake ores.

Criticism of Foreign Loans

SOME of those who criticize our loaning so much money abroad have aimed at a symptom instead of looking at the cause. The size of the item naturally attracts attention but mere bigness is not in itself adequate reason for attack except upon one line, the difficulty of repayment or of taking care of interest. With such criticism we are not here dealing. As to size, a fair measure is supplied by the summary in the last "Balance of International Payments of the United States," which make American long-term investments abroad 11½ to 13½ billion dollars at the end of 1927. For a convenient conception we may take 13 billions at the present time, with a billion-dollar range either way.

A familiar criticism argues that it is not good economics to export merchandise and get gold in return, because merchandise is useful, being productive of comfort and well being, while gold is not, and that it is still worse to secure not gold but merely promises to pay.

Granting this fully—what is there to do about it? The criticism is leveled squarely against our lending abroad, not against the conditions that conduce to our doing so. There is merely an inference, so delicate that the absurdity is not brought out, that if the capital were not exported it would be spent at home. Now, we do not export goods which can be sold at home and similarly no domestic demand for capital goes unsatisfied.

If something is wrong, it is that there is not so much domestic demand for capital as it would be well to have. The practical view is that already we have more investment in productive enterprise than we can employ by our own wants. We export the surplus product. If we had more investments there would be still more surplus product. One of these critics, writing in a highly esteemed medium, opines that we should be better off if we had built a score more hydroelectric plants or a million new homes. Well, the hydroelectric plants would displace coal miners and to be useful would result in still more goods to be worked off somewhere, and where else but in the export market? The million homes would have to be sold or rented, and to whom?

The fallacy lies in the assumption that capital exposed for sale will make its market. The market must

first be provided, to attract the capital. Our difficulty is that the present market is supplied. All told, we are well provided with coal mines, power plants, steel mills, automobile factories and the like. As we need more there is no difficulty in finding the capital. We do need additional markets for capital, just as new things, phonographs, automobiles, radio, have in recent years been supplying markets. Airplanes are now entering, but we are told television is unlikely to become commercial for several years. We could not force capital into the old things merely by keeping it from going abroad nor should we want to do so.

The answer is that we need still more research work, to find new things to make and to do, so that there will be perfectly new demand for goods and services, and capital will be called for to put the things into practice. The recent Carnegie Institute coal conference at Pittsburgh disclosed wide possibilities along several lines. We need new opportunities, not a forcing of growth in things that are already highly competitive.

Enlarging the Panama Canal

GROWING congestion of traffic through the Panama Canal has raised the question of enlarging the capacity for passing ships between the Caribbean and the Pacific. Though only fourteen years old, in point of service, the canal at Panama already is overtaking "de Lesseps's big ditch" at Suez in annual tonnage of ships making the transit, and 1927 showed more than four times the figures of eight years earlier. The Suez Canal, in that same interval, did not quite double its traffic but both canals made new, high records last year.

	Panama Canal	Suez Canal
1927, tons	28,610,984	28,962,048
1923-27 average	25,310,916	25,924,881
1919	6,943,087	16,013,802

Much thought has been given to the subject of location. It is claimed by engineers that a third flight of locks, three at each end, would double the practical capacity of the present canal. This may well be so, though it would necessitate a better average flow of traffic and better control of transit peaks. But the element of strategy would seem to suggest that new facilities, if and when they must be provided, should be located at some distance from Panama. "All the eggs in one basket" may be perfectly satisfactory nineteen times out of twenty. On the twentieth, prudence might best be served by a separation of the eggs into two or more containers.

In the days when the present canal was but a dream—aside from the abandoned French workings—Mr. Bunau-Varilla effectively spiked the guns of those who advocated the Nicaragua route (Mr. Roosevelt, among them) by circularizing Congress, and others interested, with postage stamps of Nicaragua, showing active volcanoes where proponents declared there were none. Nevertheless, it appears to be thought that a duplicate route via Lake Nicaragua, now that we have the Panama Canal as an entity, might serve strategy and commerce equally well and properly distribute our eggs.

In any case, wherever the new facilities be built, certain details of dimensions, learned from more than a decade of operation at Panama, may well be considered. The locks in the present canal—twelve in all—are of uniform size: 1040 feet long and 110 feet width

of entrance. It is possible, often, when a small vessel is to be put through, to shorten the effective length by means of an intermediate set of lock gates, and thus to employ less water in locking the vessel up at one end and down at the other. But frequently conditions do not permit this, in which case it requires as much water to transit a motorboat as for a dreadnought, and in the dry season water already is at a premium.

As we now have facilities for ships as large as have ever been built, it would seem wise, in a new set of locks, to save much of a huge expense, both for construction and for operation, by building them much smaller than those at Panama. If they were 600 feet long and 80 feet broad they could handle nine-tenths of the ships now using the canal, and at a saving of perhaps one-half on the cost of locks duplicating those now in use.

At the same time there is a demand for a greater capacity, because certain ships now built and building tax the present locks to the utmost. Their width has hampered design in the Navy Department, where more than the 106 feet now considered maximum beam of ships, for safe passage, is wanted for the purpose of adding torpedo protection "bulges" to the sides of capital ships. It was at the insistence of the Navy that the width of the present locks was made 110 feet, in place of the 100 feet of the earlier design. When the Kaiser Wilhelm or Kiel Canal was enlarged; shortly before the World War, the narrowest passage was made 131 feet. Transatlantic liners now being built will be 1000 feet long. Such mammoth ships may not soon enter into Pacific trade, or, more particularly, into trans-Isthmian routes. But we are planning for the future. And our experience of many years tells us that considerable expansion may be expected. The largest ship sent through the Suez Canal in 1870 was of 4414 tons; in 1927, nearly 27,000 tons.

Hence a flight of large locks, measuring perhaps 130 feet wide and 1200 feet long, would seem to be indicated. Putting this flight alongside our suggested smaller one—80 by 600 feet—would supplement the Panama Canal in a dual sense. It would permit passage of ships much larger than can now use the canal; it would permit passage at much reduced cost of such ships as constitute today, and will tomorrow, the great bulk of all that make the transit.

Integration in Non-Ferrous Metals

AN increasing tendency is seen among our metal-producing companies to carry forward the integration of their business into the manufacturing end, so that the copper, lead and zinc from their refineries may go largely to their own factories. Of course this condition has previously existed to a considerable extent. The Steel Corporation for many years has been consuming all of its own spelter for its own galvanizing, and the Matthiesen & Hegeler Zinc Co. and the Illinois Zinc Co. have used the major part of their product for their own rolling. The New Jersey Zinc Co. has become more and more a manufacturer of products of diverse character. More recently Anaconda acquired extensive copper and brass manufacturing interests. The American Smelting & Refining Co. and Phelps, Dodge & Co. have been doing likewise.

The manufacture of brass in the United States amounts to about 540,000 tons a year, whereof about

240,000 tons is made by the division classified as founders, who produce castings; and the other 300,000 tons by the division described as fabricators, who make rods, wire, sheet, tubes, etc. These are the largest and most profitable concerns. There are only 16 of them. That is to say, about 300,000 tons of brass is made annually by sixteen fabricators, while the other 240,000 tons is made by founders, large and small, whose number runs to more than 1000.

This gives some idea of the market for high-grade zinc. The brass founders do not use any of that. The brass fabricators use it to a considerable extent, but their practice in this respect is not uniform. Probably the American Brass Co. uses a larger proportion than any other concern.

Phelps, Dodge & Co. recently acquired an interest in the Bridgeport and Bristol brass companies. The American Smelting & Refining Co. has just taken a large interest in the Republic Brass Corporation that has been organized to take over the Dallas, Michigan, Rome and Taunton-New Bedford plants.

In the present alignment Anaconda is interested in about 42 per cent of the brass fabrication, the American Smelting & Refining Co. in about 15 per cent and Phelps, Dodge & Co. in about 7.5 per cent. The large independents are Scovill and Chase, which together do about 28 per cent of the business. Scarcely any of these fabricators limit themselves to brass. The same concerns do practically all of the fabrication of copper into rods, wire, plates, sheet, tubes, etc.

In lead the American Smelting & Refining Co. has an important interest in the recently formed General Cable Co. that does a large part of the manufacture of lead covered cables.

On the other hand some of the manufacturing companies have integrated themselves backward. Thus both the National Lead Co. and the Eagle Picher Lead Co. produce a considerable portion of their own lead.

A few large consumers have neither their own production nor manufacture, but buy directly the refined metals they need and have them manufactured on toll. The General Electric Co. and the Electric Storage Battery Co. are the most important examples of this practice.

That Airplane Industry

AIR transport by heavier-than-air machines has completed its first quarter century and speculation is now rife as to its future. Lurid pictures have been painted, as usual, for the commonplace would not satisfy. It remains that airplane manufacture is now getting under way in this country at a tremendous rate, and the succeeding years will surely show large consumption of iron, steel and other metals and further stimulate metallurgical investigations. While it may doubtless be true, as those best positioned to prophesy say, that the airplanes of a few years hence would not now be recognized, no one fails to acknowledge dependence, past and future, on researches among special metals and alloys.

The anniversary of the discoveries made by the Wright brothers at Kitty Hawk, N. C., twenty-five years ago, is still so recent that one may recall readily the ponderous tomes published in Europe, particularly in France, discussing seriously the scientific and engineer-

ing basis of flying, but at the same time always bringing the easy smile in general engineering circles. Yet in only a matter of a few months it will be clear to the man on the street that we already have a new and lusty industry.

Funds for Future Pensions

THE cost of an industrial pension system should be provided for during the productive years of the men who are to benefit from it after their years of usefulness have ended. According to Ingalls Kimball, director of group annuities of the Metropolitan Life Insurance Co., it should be considered in the same light as depreciation or any other item of overhead or operating expense.

This, however, is not the common practice. One reason is that almost every pension plan contains a provision permitting its alteration or withdrawal, no legal liability being assumed, no contract existing. Another reason in many cases is that the growth of industry has been so rapid that until within recent years pension payments (arising, of course, out of the very limited number of employees remaining from the relatively few who made up the early working force) have been so small, when compared to the active payroll, that they have scarcely seemed worth serious consideration.

Those strong companies that have been operating a pension system through good years and bad for a considerable period appear to be satisfied with results attained, without troubling with established funds. Their pensions are paid as a supplementary payroll, and enter into current costs and into prices charged for products. But a company whose forces are growing apace, planning to establish a pension system, might very well heed Mr. Kimball's argument. Conditions are changing.

It is well recognized as a not inconceivable eventuality that industrial pensions will become, as generally compulsory as workmen's compensation and so be a fixed charge. A certain percentage of the working forces of today will be the pensioners of a future not very far distant, and the sum total of the benefits paid them will constitute an item by no means negligible.

Mr. Kimball in fixing the basis of his theory said: "Last year the Pennsylvania Railroad paid to retired employees approximately \$6,000,000; yet from no one of these pensioned employees did the railroad receive a penny's worth of value. This \$6,000,000 when charged, as under the Interstate Commerce regulations it must be, to operating cost, increased the cost of transportation without improving it. It was paid because of service rendered to the railroad during the active years of the former employees who are now pensioners. It was paid, in other words, as partial recompense for work done—for man power expended—years ago." Yet the railroad would hardly enter in its operating cost of today an item of \$6,000,000 paid this year for coal burned or electric power consumed during years that have gone by.

Apparently there is ample experience upon which to base an annual charge for pension account. Industries have carried on these systems for sufficiently

long periods to determine what percentage of workers may be expected to fulfill requirements, such as length of service at the given retirement age, say 65 years. Actuarial figures are available as to what the life expectancy may be among those who become pensioners.

These problems can be solved with a close approach to accuracy. With a predetermined pension rate, based perhaps on previous earnings and length of service, it does not seem a difficult task to determine the annual charge to pension account.

Italy Lacks Adequate Natural Resources

Fascist Rule Born of Chaotic Conditions—Continuance Depends on Success in Solving Country's Economic Problem

BY EDWIN C. ECKEL*

SOMEWHERE IN ITALY, Nov. 11.—It is the tenth anniversary of Armistice Day, and it is also the King's birthday, so all Italy is in holiday. And since Oct. 28 it has been the seventh year of Fascist rule in Italy.

Both in France and England the government has been, for some years past, in extremely conservative hands; and the best opinion seems to be that at the next general elections there will be little shift in control in either country. Yet it must be borne in mind that in each case the control is in the hands of what is really a minority group, carried into power at the moment by popular fear of worse things from its opponents. In England the Labor Party casts the largest single block of votes and can undoubtedly come into power whenever it is united on its own policies, provided those policies are not so extremely socialistic as to alarm all the other classes of the population. In France the largest single party is also one that is much more radical than the group now in power, and it too could easily take over the government under corresponding conditions. The present very conservative administrations in both countries owe their positions to two factors—the flirtations of the extreme Labor people with red Moscow and the rapid fall of the franc and the pound some years ago. Everyone in either France or England who had any money, or hoped ever to have any, was brought to back extreme conservatism as a protest against those two things.

Fascism a Reaction from Extreme Conditions

In Italy conditions had become far worse and the resulting reaction went past conservative parliamentary rule into the pure absolutism of Fascism.

After the war Italy had drifted rapidly toward what was practically anarchy. The old political "leaders" had shown themselves entirely incapable of leadership in any real sense, and they simply bowed before the socialistic storm that broke out in northern Italy. Strike followed strike; factory after factory was seized by its laborers with the idea of operating a Soviet or exercising trade-union control of industry—and still the politicians at Rome did nothing. Another year or so and Italy might easily have surpassed Russia in the adoption of Red doctrines.

It was only after this chaotic condition had continued for four years that the Fascist reaction against it broke out suddenly and triumphed with equal suddenness. It has now lasted for six years and it still gives the country a strong and efficient government. And that, after all, is what Italy needed most from 1914 to 1922.

The Fascists' régime is a very strong rule, and it has the defects, as well as the advantages, of that strength. It is nationalist to the core, it is chauvinist at times, it may at times be looked upon as a menace by neighboring countries. But from the purely Italian point of view it has succeeded in making the Italians respect themselves, and by

consequence has forced other countries to respect the Italians. That, as I say, is from the purely Italian viewpoint; but, after all, any government must be judged first of all in its effects upon its own people.

In accomplishing all this it has been necessary to suppress political action, speech and press. In 1920 there were 11 political parties in the legislature at Rome, and no one could ever get agreement on any subject whatever. Today there is only one political party and its program is carried out without opposition or discussion.

The Fascist rule is based upon certain ideals as to state unity. Its support was primarily derived from the soldiers who had fought for Italy and who returned to find the politicians looking on while the socialists prepared to sovietize the country. With all this came also support from the bourgeoisie—the middle classes and the industrialists, who were unfavorable to a Soviet régime. Fascism offered a preferable alternative, and it was accepted by these powerful classes.

It will be seen that I agree entirely with all of my Italian friends who say that Fascism was born of cold necessity, and that it has given them a clean, strong and efficient government, for the first time in many years.

Italy's Poverty Hardest Fascist Problem

The past and present of Fascism are clear enough; its future is still not clear. And that, not judging from political theories, but from economic facts. Italy is a poor country, not only financially, but as regards natural resources. There is no coal whatever in Italy; there is practically no petroleum; there are no lead, zinc or copper mines; there is only one important iron mine, whose reserves may be figured in millions of tons. As against these deficiencies there are water-power, sulphur and some 10 or 20 million tons of aluminum ore.

The real Fascist problem is one of making it possible for a large population to live in Italy. That may be done by development of water-power and of industries using the power produced. And a solution of this type, if practicable, would mean that Fascism had proved its worth and might remain in power indefinitely. Other than that possible solution there are only two alternatives: to decrease the population by emigration or deliberate reduction in the birth rate, or to acquire new grain or coal lands by settlement, treaty or war.

My data on Italian labor conditions are too incomplete to be taken too seriously. Ten days in a country does not give a very clear idea of average conditions. But at one large group of mills the average pay of common labor is now 18 lire per 8-hr. day, or about 95c. a day. At other mills and factories I find rates from common to skilled labor ranging from 2 to 3 lire an hour, equivalent to 85c. to \$1.20 a day. These are all in the Northern industrial district and probably represent well over the average working income in the country at large.

*Mining geologist, 1503 Decatur Street, Washington.

Iron and Steel Markets

Steel Output Gains at Chicago

Increased Production in West Offsets Declines Elsewhere—
Another Advance in Scrap—New Prices
on Plates and Shapes in East

DESPITE holiday and inventory considerations, steel ingot output for the country at large is more than holding its own, although declines are reported at some plants.

Specifying, in most districts, has been heavy in sheets, tin plate and wire products and cautious in lines where a price incentive has been lacking, while new business has been in unimpressive volume. At Chicago, however, total specifications are second only to those of the first week of January, and sales, influenced by orders for rails and track supplies, are well up to the average of the past six weeks.

Pig iron demand has diminished with the approach of the year-end, and price weakness has appeared. Valley foundry iron has declined 50c. a ton to \$17.50, furnace, and a softer market has developed along the Eastern seaboard. A Tennessee furnace has withdrawn a recent advance of 50c. a ton.

Scrap, on the other hand, shows further strength. Heavy melting steel at Pittsburgh, now \$18 a ton, has recovered in two weeks the peak position it held in October.

Sectional contrasts are evident in steel output. Operations of a leading Buffalo district producer have declined to 60 per cent of capacity, but the average for the Greater Pittsburgh district is unchanged at 80 per cent, and production at Chicago has risen to 85 per cent, compared with 83 per cent a week ago. Open-hearth operations in Alabama are at the highest rate of the year. The average output of Steel Corporation subsidiaries, estimated at 85 per cent, compares with a recent rate of 84 per cent.

The production situation also emphasizes contrasts among products. Heavy releases of sheet tonnage prior to the mid-month deadline on contract specifications have given producers backlogs that will carry them well into January. Mills are operating virtually full and Christmas shutdowns will probably be limited to two days. Tin plate output continues at 87 per cent and also promises to carry through the month with a minimum interruption. Rail output is at an ascending rate, as a result of specifications against 1929 contracts.

In wire products, releases against contracts expiring Jan. 1 have been stimulated by the recent advance in prices. Since these specifications will be accepted until the end of the month, a test of the new quotations is necessarily deferred.

The market situation in bars, plates and shapes is quieter in most districts. Many buyers did not specify fully against their fourth quarter contracts and, not being apprehensive regarding prices, are in no haste to

commit themselves for the next quarter. At Chicago, however, bar bookings for the week exceeded shipments. A feature of the Western market is the increasing demand from the farm equipment industry, which has temporarily forged ahead of automobile manufacturers as the largest user of bars.

First quarter prices on bars, plates and shapes at Eastern mill basing points, announced by the Bethlehem Steel Co., include minimum quotations on the last two products that are \$1 a ton lower than had been commonly conceded as representative of the market. The move is interpreted as an effort to stabilize prices named to the largest buyers by substituting a single open quotation for varying preferentials. To compete for Eastern business of this category mills using a Pittsburgh base will have to quote 1.80c. to 1.85c.

A gas line from Baxter Basin, Wyo., to Ogden, Utah, requiring 33,000 tons of plates, has been placed with a Milwaukee fabricator. That company is also reported to have taken an order for 200 miles of 16-in. pipe for the El Paso Natural Gas Co. Line pipe business placed this year is estimated at close to 1,000,000 tons.

Rail bookings have been augmented by a 15,000-ton order from a Western road. Although fewer roads have bought than had placed contracts up to this time in 1927, mills look for no decline in total tonnage booked when the rail buying movement is completed.

Fabricated steel orders for November, computed at 243,750 tons, were 3 per cent above the total for the same month last year, but were the smallest, except for October, since April.

Although sales gained, there was a slowing down in both production and shipments of steel sheets in November, according to reports compiled by independent mills.

Ohio River shipments of steel in November, at 137,000 tons, established a new monthly record. The total for the 11 months of this year, at 1,162,000 tons, exceeds by 150,000 tons the combined movement for the two previous years. Eastbound shipments of pig iron on the New York State barge canal also reached a new high, totaling 122,500 tons for the 1928 navigation season.

Iron ore receipts at Lake Erie ports this year totaled 36,959,000 tons, a gain of 406,000 tons over 1927. A much larger increase was shown in shipments to other than Lake Erie ports—mainly to the Chicago district—for which the total was 16,490,000 tons, or 2,447,000 tons more than in the previous year.

THE IRON AGE composite price for pig iron has declined from \$18.59 to \$18.46 a ton, its first drop since July. The finished steel composite remains unchanged at 2.391c. a lb.

Pittsburgh

Heavy Sheet Specifications—Steel Business Generally Is Good for December—Foundry Iron Off 50c.

PITTSBURGH, Dec. 18.—While the close proximity of the holiday season occasions some slowing up of demand, the flow of specifications as a whole is not materially lighter than it has been, and it has been really heavy in sheets as a result of the mid-December deadline on the acceptance of specifications on fourth quarter contracts. At least two manufacturers lately have found it necessary to work an extra turn on some of their sheet mills, and the problem now is whether they can limit in mill operations the observance of Christmas to merely the day before and the holiday itself. Tin plate manufacturers also have sufficient business to want to suspend mill operations only on next Monday and Tuesday.

There has been no decrease in ingot production in this and nearby districts, and, though next week may see some recession, it is commonly expected that December will round out a succession of good months in output.

Rail mill engagement is increasing, but, as an offset, pipe mills show a tendency to a declining operation. Two good-sized line pipe orders went West recently. Some of the large pipe furnaces are down as a result of completion of old orders.

There is much interest in the price announcement of the leading Eastern producer of bars, plates and shapes, especially as it means that on Eastern business local mills will now have to

do 1.80c. to 1.85c., Pittsburgh, on plates and shapes to compete with Eastern mills.

The test of the new wire schedule is somewhat delayed by the fact that makers still owe considerable tonnages to distributors on old contracts.

The inside prices on hot-rolled strips are not being strictly confined to the so-called round tonnage buyers, and there are reports that some makers of cold-rolled strips of lim-

ited capacity have found it necessary to go under the regular price of 2.85c., base, to secure orders. In the latter case, however, there is no general recognition of the concession, since those making it account for so little of the total production.

Some large users of bars seem to think they should be given preferential price treatment when their orders are of sufficient size to enable the mills to cut producing costs.

The scrap market has a very strong undertone and presents some rather unusual price movements and relationships. A sale of a round tonnage of heavy breakable cast scrap to a melter that has used it very infrequently in the past was at \$2 or more a ton above the last previous sale of importance. As much as \$19 has been paid for compressed sheets by a melter using no other grade to any considerable extent; that grade is very scarce and at \$19 is at a premium of 50c. a ton over the highest price actually paid in this district for heavy melting steel.

A reappearance of \$17.50, Valley furnace, for No. 2 foundry iron, a drop of 50c. a ton, stands out in a dull and uninteresting pig iron market. This came on a tonnage that has

presented the only real test prices have had recently.

Pig Iron.—A price of \$17.50, Valley furnace, again has appeared on No. 2 foundry iron, one fair-sized tonnage for shipment over the first quarter of next year having been placed at that price. The small-lot market remains quotable at \$18 for this grade. It had been observed in these reports recently that the test of large inquiry was lacking. Business in iron generally is slow, as it usually is at this time of the year. Some producers report a slackening of specifications on old orders, owing to the approach of the holiday period, but generally shipments are holding up well, and most producers find the outward movement exceeding production. There is little interest in the steel-making grades, although one melter has taken prices on a round lot of basic iron. This inquiry does not appear to have produced lower prices than \$17.50, Valley furnace. That this grade should show some resistance to pressure is probably due to the fact that the scrap market lately has shown considerable strength and with it is the possibility that steel makers will be obliged to use more pig iron and therefore will have less for market. Struthers furnace, Struthers, Ohio, went into blast Sunday night.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.50
Bessemer	\$18.25 to 18.50
Gray forge	17.00 to 17.50
No. 2 foundry	17.50 to 18.00
No. 3 foundry	17.00 to 17.50
Malleable	18.25 to 18.50
Low phos., copper free....	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—Shipments of billets, slabs and sheet bars still are large on fourth quarter contracts, but no considerable amount of first quarter tonnage yet has reached makers' books, nor have negotiations for that period assumed much activity. Since an advance of \$1 a ton over this quarter's price is sought for the next quarter on sheet bars, detached mills are specifying on existing arrangements, especially as it will be well past the turn of January before fourth quarter sheet business can be

completed. Fairly good business is reported in wire rods, and no great trouble attends the efforts to line up buyers for their first quarter requirements. Rods extras have been revised, but the only changes are in the carbon range limits.

Bars, Plates and Shapes.—Buyers are specifying steadily and, while demands provide no tax either on the productive capacity or on the ability of the mills to make prompt deliveries, they are sufficient to sustain the recent rate of operations. Contracting for the first quarter also is steady rather than active, buyers generally taking the position that as higher prices are not likely in the near future there is no need of haste about commitments. In bars, some large users talk of seeking more favorable price terms; on orders for 200 or 300 tons of a size, for one rolling and one shipment, they feel entitled to some of the saving that such orders permit in rolling costs. Plate business locally suffers from light railroad car and river barge business, and, while pipe line business is heavy, it is going largely to a central Western maker, and local mills are not much benefited. Structural awards to local shops are few and small, and there are no outstanding pending projects in this area.

Rails and Track Supplies.—Operations of the local standard-section rail mill are expanding, with the specifying of 1929 rails for January delivery. Local makers of spikes, track bolts and tie plates have the promise of a share in the requirements of the New York Central Lines, but there has been no formal distribution of orders. This is the most recent inquiry of a size to test prices, and it is said that it brought out no deviations from the regular quotations. Suggestions of lower prices for tie plates from the West find no verification here.

Wire Products.—Mills still owe customers considerable quantities of nails carrying the prices ruling prior to Dec. 5. The effect of the recent advance has been to stimulate specifications. In a general way, no great re-

sistance to the new prices is being encountered, and first quarter contracting is said to be fairly heavy. Some jobbers, who, on account of the size of their purchases, are included in the class getting only 5c. per 100 lb. under the published schedule, do not like the new sales plan and are protesting.

Tubular Goods.—Line pipe and seamless oil country pipe still are active, but good demand for the former is not helping Pittsburgh district mills, as the 287-mile line of 14-in., 16-in. and 18-in. pipe for the Western Public Service Corporation gas line to run from Wyoming to Salt Lake City and Ogden, Utah, went to the A. O. Smith Corporation, Milwaukee, and that interest also is said to have taken 200 miles of 16-in. for the El Paso Natural Gas Co. line from Lea County, N. M., to El Paso. Several of the large pipe furnaces of makers in this and nearby districts are down for want of orders, while the Milwaukee producer is said to have 1600 miles of various sizes on its books. Lapwelded oil country pipe is very dull, but there is a fairly good demand for butt welded pipe for the time of year. In the new boiler tube price schedule, announced in THE IRON AGE last week, manufacturers have made a slight amendment in discounts on lots of less than 10,000 lb. of charcoal iron tubes, on which the basing discount is lowered two points, with no preferential discount allowed. In the seamless tube price list, against which the new discounts on charcoal iron and lapwelded steel tubes apply, the Birmingham wire gage on 2¼-in. tubes has been changed to No. 12 gage, or 0.109 in., and the price for standard thickness is 29c. per ft., 31c. for one extra wire gage, 35c. for two extra wire gages, 38c. for three extra wire gages and 42c. for four extra wire gages.

Sheets.—Not a little sheet business was driven in by the fact that last Saturday was the closing date on specifications on four quarter contracts, and prices for the next quarter are \$2 a ton above those ruling on

-------------------------------	------	------

Carbon Vanadium.....	0.95	3.70
----------------------	------	------

Above prices are for hot-rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¼c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis. For billets under 4 x 4 down to and including 2½ in. squares, the price is \$5 a gross ton above the 4 x 4 billet price.

Slabs with sectional area of 16 in. or over carry the billet price; slabs with sectional area of 12 in. to 16 in. carry a \$5 extra above the billet price and slabs with a sectional area under 12 in. carry the bar price.

Band sizes are 40c. per 100 lb. higher.

Rails

Per Gross Ton

Standard, f.o.b. mill.....	\$43.00
Light (from billets), f.o.b. mill.....	36.00
Light (from rail steel), f.o.b. mill.....	34.00
Light (from billets), f.o.b. Ch'go mill.....	36.00

Track Equipment

Base per 100 Lb.

Spikes, 9/16 in. and larger.....	\$2.80
Spikes, ½ in. and smaller.....	2.80
Spikes, boat and barge.....	3.00

Carbon, 0.10% to 0.30%, base (carloads).....	55
Carbon, 0.30% to 0.40%, base.....	50
Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.	

this quarter's commitments. As a result, mills are well supplied with orders in almost all finishes that will carry them well into next month, but a good many buyers, by the same token, will secure no small part of next month's requirements without being obliged to pay any advance in prices. It is not helpful to the early 1929 market that a good deal of roofing material lately released will hardly enter consumption until along in February. Mill operations are approximately full this week, and except for such recession as is occasioned by the observance of Christmas, there will be full operation next week. Manufacturers generally plan to suspend at noon the Saturday before Christmas and will not resume until the second turn on Wednesday following the holiday.

Tin Plate.—Complete suspension of a Chicago district independent tin plate plant is planned for all of next week, but generally manufacturers are so well supplied with business that a strong effort will be made to confine observance of Christmas in the mills to Monday and Tuesday. The course of the Chicago mill is dictated by a belief that it will be hard to keep the crews intact during the holiday week. Spot demands still are good and specifications for early 1929 requirements are pouring in freely. This week's mill engagement is about 87 per cent of capacity.

Cold-Finished Steel Bars and Shafting.—Real activity is lacking, although specifications are being made steadily and no resistance is encountered in getting consumers to sign up for their first quarter needs. Present automobile production is moderate, and early 1929 plans wait on the results of the showing of new models.

Old Material.—Surface activity is not great, but under the surface the market is boiling as a result of the

growing realization that supplies of the steel works grades are none too large and a belief that between now and the end of the year steel makers will have to buy. Heavy melting steel has been sold at \$18.50 in this district, and none seems available at less than \$18, while up to \$19 has been paid by one consumer for compressed sheets for shipment from the Detroit district. There is sympathetic strength in railroad specialties and in low phosphorus scrap. A sale of 10,000 tons of heavy breakable cast scrap to a Pittsburgh district steel company is noted at \$15.50. The last previous sale of this grade of any importance was at \$13.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:

Heavy melting steel.....	\$17.50 to \$18.50
Scrap rails	18.00 to 18.50
Compressed sheet steel....	18.00 to 19.00
Bundled sheets, sides and ends	17.00 to 17.50
Cast iron carwheels.....	15.00 to 15.50
Sheet bar crops, ordinary..	18.50 to 19.00
Heavy breakable cast.....	15.00 to 15.50
No. 2 railroad wrought....	18.00 to 19.00
Hvy. steel axle turnings...	16.00 to 16.50
Machine shop turnings....	11.50 to 12.00

Acid Open-Hearth Grades:

Railr. knuckles and couplers	19.00 to 19.50
Railr. coil and leaf springs	19.00 to 19.50
Rolled steel wheels.....	19.00 to 19.50
Low phos. billet and bloom ends	21.00 to 21.50
Low phos., mill plates.....	19.50 to 20.00
Low phos., light grade....	18.50 to 19.00
Low phos., sheet bar crops	19.50 to 20.00
Heavy steel axle turnings.	16.00 to 16.50

Electric Furnace Grades:

Low phos. punchings.....	19.00 to 19.50
Hvy. steel axle turnings..	16.00 to 16.50

Blast Furnace Grades:

Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings.....	12.00 to 12.50

Rolling Mill Grades:

Steel car axles.....	20.00 to 21.00
No. 1 railroad wrought....	13.50 to 14.00
Sheet bar crops.....	19.00 to 19.50

Cupola Grades:

No. 1 cast.....	14.50 to 15.00
Rails 3 ft. and under.....	19.50 to 20.00

Hot-Rolled Flats.—Hot-rolled strips still are quoted at the recent price range, but while it is said that no further concessions have been made to large consumers, it is admitted that the inside prices are extending to the small-tonnage buyers. Specifications are fairly steady on old orders, and a fair amount of first quarter business has been written, although some of the very large users are yet to close for their requirements.

Cold-Rolled Strips.—Makers generally are holding firmly to 2.85c., base, although a few deviations from that price are said to have been made by producers whose capacity is limited. Specifications are coming in fairly freely and much first quarter business has been written at the full quotations.

Coke and Coal.—Two blast furnaces, expected to go in this month, have not been lighted and this has left the spot supply of furnace coke a little too large for requirements.

Prices still are easy, although producers have not been obliged to go below \$2.75 per net ton at ovens. First quarter coke for a Buffalo furnace and a central Pennsylvania furnace was placed recently at prices ranging from \$2.80 to \$2.85. Foundries generally are under cover for their coke requirements for the first quarter and half of next year. Production of slack coal has decreased and now is more in line with demand, with the result that prices are slightly firmer; the market otherwise is as dull and weak as ever.

Urges Free Clinic as Safeguard to Workers' Health

Edward N. Hurley, chairman of the board Electric Household Utilities Corporation, Chicago, has offered to assist in raising funds for the construction of a community clinic on McKinlock Campus of Northwestern University, Chicago, if that institution will provide the site. In a letter to Walter Dill Scott, president of the university, Mr. Hurley states that business losses from technical and managerial incompetence are of minor importance compared with the loss from preventable bodily defects and breakdowns among the nation's workers. The present annual loss of time caused by preventable illness of 42,000,000 workers employed in gainful occupation, he said, is 350,000,000 hours.

The plan contemplates giving periodical physical examinations free to those without means, but fees would be charged those who can afford them.

Railroad Traffic in First Nine Months

Freight traffic in the first three-quarters of 1928 reached 349,164,000,000 net ton-miles, according to figures of the Bureau of Railway Economics, Washington. This shows a decrease of about 2¼ per cent compared with 1927 and also with 1926.

Improved operating performance has been achieved in many ways. Freight cars in the first nine months have moved an average of 30.7 miles a day, representing an almost continuous increase from 27.6 miles in 1923. This includes all cars in service, either in transit or standing still. Net tons per freight train have increased from 718 in 1923 to 787 in 1928. Freight train speed has risen consistently from 10.8 miles an hour in 1923 to 12.9 miles in 1928. Gross ton-miles per freight train-hour have increased consistently from 16,607 in 1923 to 23,537 in 1928.

Fuel consumed for each 1000 gross ton-miles in freight service has improved progressively from 161 lb. in 1923 to 126 lb. in 1928. Similarly, fuel consumption in passenger service has improved from 18.2 lb. per passenger train car-mile in 1923 to 14.9 lb. in 1928.

Steel Releases Indicate Heavy Shipping Volume Early in New Year—Ingot Output Up to 85 Per Cent

CHICAGO, Dec. 18.—Demand for most of the grades of finished steel products remains at a high level, and, with rail mills now rolling on 1929 schedules, ingot output in the Chicago district has advanced to 85 per cent of capacity. Rail mill production has been stepped up 10 points to 60 per cent of capacity in the past week.

A sense of security has taken hold of buyers and sellers. There is less hesitancy in placing forward orders, with the result that books are growing and release orders point to a heavy shipping volume after the turn of the year. Building construction in Illinois in 1928 will exceed the figure for the previous year by not less than 15 per cent. This, however, is not a true reflection of structural steel demand because there was a decrease in small structures, whereas there has existed in the past 12 months a large demand for tall steel frame structures, industrial buildings and railroad and highway bridges.

Railroad equipment contracts are slow in maturing, but the pending volume is large and additional inquiries are in the making. Car shops are reacting slowly to the prospect of an increasing volume of business. It is evident that shop organizations will be built cautiously until a better perspective is to be had of the proportions the car buying movement will attain.

Sales of finished steel products, again influenced by new orders for rails and track supplies, are well up to the average of the past six weeks. Specifications are second only to those of the peak week of the year, which came in the first week in January, following a quiet period in December. Release orders are 50 per cent heavier than in any seven-day period since early in March. This is a reflection of the relatively high consuming demand in December, this year, and it promises shipments in the coming month that will exceed the volume sent from mills in the first month of 1928.

Pig Iron.—Buying of Northern pig iron is light, being confined to odd lots for immediate use. Shipments are well sustained, but a slower rate is expected during the holidays. First quarter coverage is unusually complete, and specifications for release after Jan. 1 are large. In general, melters covered well for the fourth quarter, and spot buying, particularly in the past three weeks, has been in smaller volume than usual at this time of year. Shipments of charcoal iron are heavy, and prices are steady at \$24 a ton, furnace. Shipments of Southern iron into this district in December give promise of being the largest for any month so far this year.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25...	\$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75...	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail) ..	\$22.51 to 23.01
Low phos., sil. 1 to 2, copper free..	29.50
Silvery, sil. 8 per cent.	30.79
Bess. ferrosilicon, 14-15 per cent...	47.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—The price of ferromanganese is steady at \$105 a ton, seaboard. The spiegeleisen market is quiet.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegeleisen, 19 to 21 per cent, \$40.76.

Coke.—Shipments of by-product foundry coke are heavy and equal to production. Producers' stocks are light. Prices are firm at \$8 a ton, f.o.b. local ovens.

Bolts, Nuts and Rivets.—Specifications are heavier, but for the most part for delivery after the turn of the year. Producers, finding shipments lighter, are building stocks against deliveries to be made after Jan. 1.

Wire Products.—Forward contracting is sluggish and spot purchases are dull as the end of the year approaches. Orders from the jobbing trade in the South are in good volume, but in the Northwest orders are lighter. Specifications from the manufacturing trade are smaller. Producers, anxious to hold stocks in most lines at their present size, have curtailed output, the average now being about 62 per cent of capacity. Shipments of road mesh are light, but deliveries of woven wire fencing are in good volume and give promise of bringing the total tonnage for 1928 in line with that of 1927. Jobbers' stocks of nails are said to be small, and current orders are more numerous than usual at this time of year.

Reinforcing Bars.—Buyers of reinforcing bars have been unusually inactive, considering that a round tonnage is pending. Architects are busy, so must dealers attribute the lull in business to the holiday season and expect a more active market soon after the turn of the year. Shipments from shops are in good volume for this time of the year. Backlogs are shrinking and ship operations are tapering. Warehouse prices now being named are 2.35c. a lb. for the billet bar product and 2.20c. for rail steel bars. Protections on old quotations expired Dec. 15.

Sheets.—This market is quiet. For the most part, users have specified in full against fourth quarter contracts,

but insist that much of the tonnage be held for shipment after the turn of the year. Producers get reports that stocks in the hands of most consumers are light and on that score they anticipate a sharp upward turn in specifications and new buying after Jan. 1. Among the more active users of sheets at this time may be named car builders, who are in the market for roofing sheets; the agricultural implement trade and manufacturers of furnaces. Sales are unusually light and do not afford a satisfactory test of the market.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.00c.; No. 24 galv., 3.75c.; No. 10 blue ann'd, 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—The American Cast Iron Pipe Co. has taken 1800 tons of pipe for Racine, Wis., at \$35.75 a ton, Birmingham, or \$44.25 a ton, delivered. This price is \$2.25 a ton above the lowest quotation by an American maker last week at Detroit. Producers have not named winter buying prices, and so far local conditions and the character of orders seem to be the determining factors in setting prices for orders to be delivered in the spring. Car lots are moving in this district at \$37 to \$38 a ton, Birmingham. Several public utilities are preparing schedules for 1929. Deliveries are prompt on practically all common sizes.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$46.20; 4-in., \$46.20 to \$50.20; Class A and gas pipe, \$4 extra.

Structural Material.—Reports are persistent that the Chicago Board of Trade Building, requiring 18,500 tons of steel, has been placed with a local fabricator. As a general thing, the local market is quiet. Awards for the week total 2000 tons and fresh inquiry is for 1200 tons of bridges for the Kansas City Southern. The bulk of the steel needed for the Mercantile Mart, 38,000 tons in all, has been shipped here by boat and the work of fabrication in local shops will soon be under way. Shops are operating at a fair winter rate, and the anxiety to maintain present schedules leads to keen competition, with no improvement in prices. Deliveries on shapes are improved, mill promises now being from two to three weeks. Forward contracting is moderately active at 2c. to 2.10c., Chicago. Following the custom in recent years, fabricators are not inclined to make blanket contracts, but prefer to buy against actual awards.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Plates.—Outstanding among orders for plates this week is 33,000 tons placed by a Milwaukee welded pipe maker for a 287-mile gas transmission line from Baxter Basin, Wyo., to Ogden, Utah. An oil producer in Texas has ordered storage tanks to be fabricated in this district that will take 6000 tons of plates. Miscellaneous inquiry for similar projects in the Southwest will take 8000 tons. Or-

ders for railroad equipment total 200 gondolas, requiring 3000 tons of steel. It is reported that the Santa Fe is making revisions to its recent inquiry for passenger train equipment. Although specifications against recent car orders are now being sent to mills by shops, the total tonnage is not of large proportions. Builders of railroad equipment operated at very low capacity all through the fall months, and they are moving cautiously in the matter of building larger organizations than needed at this time for work in hand. This is tending to make orders move slowly through shops. Deliveries on plates range from two to three weeks, and it is generally estimated that car shops will not increase operations until late in January. Prices for plates in Chicago are steady at 2c. to 2.10c. per lb.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Hot - Rolled Strip.—Forward contracting in and near Chicago in hot-rolled strip is making rapid headway among the smaller users. Some large buyers, notably those in Detroit, are staying out of the market. Current specifications are in good volume.

Rails and Track Supplies.—Chicago rail mills have started to roll against 1929 contracts, and, as a result, output has been advanced to 60 per cent of capacity. A Western railroad has closed for 15,000 tons of standard-section rails, and inquiry stands at 70,000 tons. The Illinois Central, the Burlington and the Rock Island are among the large Western lines that have not yet made 1929 commitments. Miscellaneous purchases of track supplies total 18,000 tons, and fresh inquiry is for a like amount and includes 8000 tons of iron tie plates. Although the general market for steel tie plates holds at \$43 a ton, there are reports of concessions on several recent orders.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Old Material.—The Chicago scrap market is less active as the holiday season approaches. Large consumers

of the heavy tonnage grades will still take shipments on contracts and small users continue to hold stocks to the minimum and enter the market for carloads as required. It is said that the Illinois Central obtained \$17.05 a ton on track for 1000 tons of rerolling rails. The supply of borings appears to be a trifle short of demand and dealers are paying \$12.25 to \$12.30 a ton delivered. The cast iron car wheel market is quiet and prices are easier, as gaged by a recent sale of several hundred tons. Shortage of the malleable grades is not relieved, and prices are strong. Shipments by railroads are well sustained, but cold weather and snow may hamper the gathering and preparation of scrap, with resultant lighter shipments.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$14.50 to	\$15.00
Shoveling steel	14.50 to	15.00
Frogs, switches and guards, cut apart, and misc. rails	15.75 to	16.25
Hydraul. compressed sheets	13.00 to	13.50
Drop forge flashings.....	10.50 to	11.00
Forg'd, cast and r'l'd steel carwheels	17.75 to	18.25
Railr'd tires, charg. box size	17.50 to	18.00
Railr'd leaf spring cut apart	17.50 to	18.00
Acid Open-Hearth Grades:		
Steel couplers and knuckles	16.00 to	16.50
Coil springs	18.25 to	18.75
Electric Furnace Grades:		
Axle turnings	14.50 to	15.00
Low phos. punchings.....	16.50 to	17.00
Low phos. plate, 12 in. and under	16.50 to	17.00
Blast Furnace Grades:		
Axle turnings	12.00 to	12.50
Cast iron borings.....	11.75 to	12.25
Short shoveling turnings..	11.75 to	12.25
Machine shop turnings....	8.00 to	8.50
Rolling Mill Grades:		
Iron rails	15.00 to	15.50
Rerolling rails	16.50 to	17.00
Cupola Grades:		
Steel rails less than 3 ft..	17.25 to	17.75
Steel rails less than 2 ft..	19.00 to	19.50
Angle bars, steel.....	16.50 to	17.00
Cast iron carwheels.....	14.00 to	14.50
Malleable Grades:		
Railroad	17.00 to	17.50
Agricultural	12.50 to	13.00
Miscellaneous:		
*Relaying rails, 56 to 60 lb.	23.00 to	25.00
*Relaying rails, 65 lb. and heav.	26.00 to	31.00

Per Net Ton

Rolling Mill Grades:		
Iron angles and splice bars	14.50 to	15.00
Iron arch bars and transoms	20.50 to	21.00
Iron car axles.....	26.50 to	27.00
Steel car axles.....	15.50 to	16.00
No. 1 railroad wrought...	13.25 to	13.75
No. 2 railroad wrought...	13.00 to	13.50
No. 1 busheling.....	11.50 to	12.00
No. 2 busheling.....	6.00 to	6.50
Locomotive tires, smooth..	13.25 to	13.75
Pipes and flues.....	9.50 to	10.00
Cupola Grades:		
No. 1 machinery cast.....	15.50 to	16.00
No. 1 railroad cast.....	15.00 to	15.50
No. 1 agricultural cast.....	14.50 to	15.00
Stove plate	12.25 to	12.75
Grate bars	12.50 to	13.00
Brake shoes	11.50 to	12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Bars.—Buying is active, and for the week totals more than shipments. Deliveries of mild steel bars range from three to five weeks. Now that the automobile manufacturers have dropped to a lower rate of output,

farm machinery makers are again in the lead as the largest single group of bar users. A review of the year brings to light more forcibly than before the rapidly spreading use of steel bars, not only in total tonnage, but in a much wider circle of consumers. Specifications for alloy steel bars are in fair volume, and prices, with forward contracting practically completed, are steady. The local iron bar market is quiet. Most users of rail steel bars are committed for the first quarter at 1.95c. per lb., Chicago Heights. Specifications have dropped sharply for bars that are to be delivered before the first of the year, but releases are large for shipments after Jan. 1.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Ohio River Steel Tonnage Mounting

Steel products moved on the Ohio River made another high record mark in November, the monthly report of the United States Corps of Engineers, Pittsburgh office, reports, with a total of 137,019 net tons. The best previous record, made in October, was bettered by almost 7000 tons.

Total tonnage for the year to Nov. 30 was brought to 1,162,445 tons. This also is a record figure and approximately 150,000 tons in excess of the combined movement for the entire years of 1926 and 1927. For the 11 months last year the movement was 628,790 tons, of which November contributed 70,863 tons.

Large Automotive Parts Makers to Be Merged

The Borg-Warner Corporation, Chicago, and the Galesburg Coulter-Disc Co., Galesburg, Ill., large manufacturers of automobile and agricultural implement parts, will be consolidated through an exchange of stock, probably on a share for share basis. The Borg-Warner Company was formed this year by a merger of the Borg & Beck Co., the Marvel Carburetor Co., the Warner Gear Co., and the Universal Joint Co., and manufactures carburetors, transmission gears and universal joints. Its plants are at Chicago, Rockford and Moline, Ill.; Indianapolis and Muncie, Ind., and Flint, Mich. The Galesburg Coulter-Disc Co. last year absorbed the Indiana Rolling Mill Co., Newcastle, Ind., and manufactures sheet steel shovels, blades for farming implements, and discs for automobile clutches, with plants at Galesburg and Newcastle.

Messrs. C. P. Sandberg, consulting and inspecting engineers, London and New York, have removed their offices in the latter city to the Cunard Building, 25 Broadway.

Philadelphia

Minimum Prices on Plates and Shapes Reduced \$1 a Ton—Contracting Light

PHILADELPHIA, Dec. 18.—Eastern Pennsylvania producers of plates and shapes expect to follow the action of the Bethlehem Steel Co. in reducing prices on plates to a minimum of 2c., Coatesville, and shapes to 2c., mill. The revision on shapes formally recognizes prices that have prevailed on desirable business for some time. Some first quarter plate contracts, however, have been closed at the former level of 2.05c., Coatesville, and on such business it may be necessary to rewrite the contracts to the new level, which had previously been granted only to certain large users. Bar quotations are unchanged at 1.90c., Pittsburgh, and 2c., Lackawanna, for first quarter contracts. Black and galvanized sheet prices are quite firm for first quarter, but blue annealed sheets range from 2c. to 2.10c., Pittsburgh. The holidays and the year-end inventory are beginning to affect the iron and steel markets, so that almost no new tonnage is being booked, and specifications for shipments on current contracts have shown a decline.

Pig Iron.—Standard foundry iron continues at \$20.50 to \$21 per ton, furnace, the higher quotation being for first quarter. While some small orders for the next quarter have been placed at the top price, substantial quantities have generally brought out \$20.50, the price for delivery to the end of this year. In the past week some contracts have been closed. About 300 tons of No. 3 foundry for the Lobdell Car Wheel Co., Wilmington, Del., went to an eastern Pennsylvania furnace and about 2000 tons of foundry grade for the Salem Brass & Iron Mfg. Co., Bridgeton, N. J., was distributed among four eastern Pennsylvania makers. The National Radiator Co., which closed a few weeks ago on a substantial tonnage of foundry iron for New Castle, Pa., has also bought 500 tons for its Trenton, N. J., plant. This order, in addition to iron still to be shipped on contracts at Trenton, is expected to be sufficient to carry the company through most of the next quarter. Low phosphorus pig iron consumers in this district are in most cases covered for their requirements in the next few months. The Virginia pig iron interest has sold about 17,000 tons of pig iron in the past week to Virginia cast iron pipe foundries. This sale has reduced the total unsold tonnage of the furnace by half.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to	
2.25 sil.	\$21.26 to \$21.76
East. Pa. No. 2X, 2.25 to	
2.75 sil.	21.76 to 22.26
East. Pa. No. 1X,	22.26 to 22.76
Basic (del'd east. Pa.)...	20.25 to 20.75
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b.	
N. Y. State furnace)...	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b.	
furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to	
2.25 sil.	25.29
Va. No. 2X, 2.25 to 2.75 sil.	25.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Bars.—Prices are firm at 1.90c. to 2c., Pittsburgh, or 2.22c. to 2.32c., delivered Philadelphia. A moderate tonnage of bars has been entered on first quarter contracts, and no recession from the present price level seems to be expected by the mills.

Shapes.—Announcement last week of first quarter prices by the Bethlehem Steel Co. established the shape market at 2c. to 2.10c., Bethlehem, or nearest mill to consumer. While this is a \$1 a ton reduction from the recent quotation of 2.05c., f.o.b. mill, it openly recognizes the level prevailing for some time on desirable business. A substantial tonnage of fabricated steel is in prospect, and pending shipbuilding contracts should provide some good orders next year.

Plates.—Revision of the market on plates to a range of 2c. to 2.10c., Coatesville, represents a decline of \$1 a ton from 2.05c., Coatesville, at which most contracts have been made for first quarter. All eastern Pennsylvania plate mills have not yet adhered to the price announced by the Bethlehem Steel Co., but expect to do so in a few days and probably will rewrite some contracts to the lower level. Specifications have diminished as the year end approaches, but some substantial tonnage is in prospect for next year.

Warehouse Business.—Orders for steel products from stock are maintained at a good level and prices are firm.

Sheets.—Contracting for the next

Warehouse Prices, f.o.b. Philadelphia

	Base per Lb.
Plates, 1/4-in. and heavier	2.70c.
Plates, 3/8-in.	2.90c.

†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

quarter has not yet developed in the proportions expected, but consumers are taking shipments quite freely on present contracts. Mills are maintaining prices firmly at 2.85c. per lb., Pittsburgh, or 3.17c., Philadelphia, on black sheets, and 3.60c., Pittsburgh, or 3.92c., Philadelphia, on galvanized. Blue annealed sheets continue to range from 2c. to 2.10c., Pittsburgh, or 2.32c. to 2.42c., Philadelphia, the lower price being for the narrower widths, on which there is competition from the continuous sheet mills.

Imports.—In the week ended Dec. 15, steel arrivals at this port consisted of 210 tons of structural shapes and 55 tons of steel bars from Belgium, 36 tons of shapes from Germany, 22 tons of steel scrap from the United Kingdom and 10 tons of ferrochrome from Switzerland. No pig iron or ore importations are reported.

Old Material.—The week has been quiet, with transactions confined to purchases by brokers filling contracts with mills. In the absence of any buying of consequence prices are unchanged. Dealers report some difficulty in obtaining No. 1 heavy melting steel at the prices they have offered, and in some cases are paying up to \$15.25 per ton for material to fill \$15.50 per ton contracts with eastern Pennsylvania mills.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel.	\$15.00 to \$15.50
Scrap T rails.	14.50 to 15.00
No. 2 heavy melting steel.	12.00 to 12.50
No. 1 railroad wrought.	16.00 to 16.50
Bundled sheets (for steel works)	11.00
Machine shop turnings (for steel works)	11.00 to 11.25
Heavy axle turnings (or equiv.)	12.50
Cast borings (for steel works and roll. mill)...	11.00 to 11.50
Heavy breakable cast (for steel works)	15.50 to 16.00
Railroad grate bars.	12.50
Stove plate (for steel works)	12.50
No. 1 low phos., hvy., 0.04% and under.	19.00 to 20.00
Couplers and knuckles.	17.50 to 18.00
Rolled steel wheels.	17.00 to 17.50
No. 1 blast f'nace scrap.	10.00 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 20.00
Steel axles	21.50 to 22.00
No. 1 forge fire.	12.00 to 12.50
Cast iron carwheels.	16.50
No. 1 cast.	16.25 to 16.75
Cast borings (for chem. plant)	15.00
Steel rails for rolling.	16.50 to 17.00

German Interests Plan Argentine Wire Mill

HAMBURG, GERMANY, Dec. 1.—The Allgemeine Electricitäts Gesellschaft and the Felton & Guillaume interests, which have acquired joint control of the Sociedad Electro Metalurgico Argentina at Buenos Aires, Argentina, plan the construction of a modern wire mill in Buenos Aires. The plant will cost close to \$1,500,000 and will produce insulated wires and cables, and some barbed wire and wire netting.

Cleveland

Steel Moving in Fair Volume for December—Some Hold-up of Shipments to Automobile Companies

CLEVELAND, Dec. 18.—Specifications against outstanding contracts for steel bars, plates and structural shapes continue to come out in fair volume, although there is no special incentive, in view of the fact that prices for the next quarter will not be higher. Some of the mills have closed first quarter contracts with most of their regular customers, but others, which have not been pushing contracts, have not made many commitments for that delivery.

While 1.95c., Cleveland, is the usual quotation on steel bars by outside mills, when using Cleveland as a basing point, some of the mills have gone to 1.90c., Cleveland, thus meeting the Cleveland mill price. Structural shapes and plates are steady at 1.90c. to 1.95c., Pittsburgh, the lower price for large-lot buyers. Small plate consumers are placing first quarter contracts with their regular sources of supply usually at 1.95c., Pittsburgh.

Sheet and strip steel are moving rather slowly to the automotive industry, although probably as well as could be expected at this time of the year. There has been some holding up of deliveries on auto body sheets, also failure to issue releases against other grades of sheets and strip steel because of delay by one automobile manufacturer in getting under production on new models. However, it is expected that a large production on these cars will be started early in January. Some automobile manufacturers have placed contracts for round tonnages of sheets and hot-rolled strip steel for the first quarter, but others have not come into the market. Most hot-rolled strip users in this territory have already contracted.

Structural material is moving well in small lots. New inquiries include 4000 tons for grade crossing elimination work in Cleveland. The hangar for the Goodyear-Zeppelin Co., Akron, requiring 6500 tons, may be placed this week.

Pig Iron.—The market has quieted down materially, although Cleveland interests sold 18,000 tons in foundry and malleable iron during the week, or the same tonnage as during the previous week. Very little of this business came from the immediate Cleveland territory. Inquiry is subsiding, and little is now pending. Most of the larger consumers have covered for the first quarter and few show any inclination to place second quarter contracts. With inventories close at hand, shipments are tapering off, as quite a few foundries are holding up shipments until the first of the year. Stocks in consumers' and furnace yards are low, but some of the furnaces will accumulate iron for their stock piles by the end of the month. Furnaces have fairly good order books for the first quarter and are holding firmly to recent prices. They do not look for any weakening in the market through surplus output, unless the demands of the steel industry should fall off to an extent that steel makers would have iron to sell. Cleveland furnaces quote foundry and malleable iron at \$18.50 and another Lake furnace interest is holding to \$19.50. The Michigan mar-

ket is unchanged at \$20. Low phosphorus iron is inactive, although a few car lot sales are reported at \$27. Some business has developed in the Chicago territory, but a \$26.50 price quoted by a Valley producer appeared too high to take the order.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$19.50
S'th'n fdy., sil. 1.75 to 2.25	\$22.50 to 23.00
Malleable	19.50
Ohio silvery, 8 per cent.	29.00
Basic Valley furnace.....	17.50
Stand. low phos., Valley..	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Sheets.—While specifications from the automotive industry, which fell off early in the month, gained slightly the past week, releases from that industry are still rather slow. Some of the automobile manufacturers during the week released fair tonnages of auto body sheets for January production. One of the body plants has accumulated a large stock because of the delay in starting production on new models of a low priced car, and sheet shipments are backing up at the mills. Not many of the larger consumers in the automotive field have as yet contracted for the first quarter. Prices lower than those regularly named for the first quarter have pretty generally disappeared.

Semi-Finished Steel.—The leading local producer has closed with all its consumers for sheet bars, billets and slabs for the first quarter and reports that all its business was taken at \$34, Cleveland and Youngstown. This mill is still operating at capacity.

Wire Products.—The price advance

*Net base, including boxing and cutting to length.

is bringing out a good volume of specifications for nails and wire against contracts that expire Jan. 1. These specifications will be accepted to the end of the month. As buyers will have good stocks bought at the old prices, it may be some time before there will be much test of the higher prices.

Reinforcing Bars.—Several fair-sized jobs that came out recently are still pending. The only award of size is a 400-ton lot in Akron. New inquiry is light. Prices are still irregular, both for mill and warehouse orders.

Iron Ore.—Approximately 500,000 tons less ore was on Lake docks Dec. 1 than on the same date a year ago, the amount having been 6,454,126 tons, against 6,944,350 tons on Dec. 1, 1927. Receipts at Lake Erie ports during the present year were 36,958,626 tons, compared with 36,552,791 tons last year. Shipments from these docks during the year to Dec. 1 were 26,136,092 tons, against 26,046,404 tons last year. The gain in Lake shipments this year compared with last year was shown largely in an increased movement to Lake Michigan ports. Shipments to other than Lake Erie ports, the bulk of which went to South Chicago, Gary and Indiana Harbor, were 16,490,048 tons this year, compared with 14,042,807 tons in 1927. Cleveland led as a shipping port, receiving 9,375,764 tons. Conneaut came second with 8,437,401 tons and South Chicago was third with receipts of 7,090,786 tons.

Strip Steel.—Specifications for hot and cold-rolled strip have slowed down. While some of the larger consumers in the automotive field have placed contracts for the first quarter, others have not yet made commitments for that delivery. On hot-rolled strip, 1.80c., Pittsburgh, for material wider than 6 in. and 1.90c. for 6 in. and narrower are now being commonly quoted. Prices \$2 a ton higher usually apply to less than car lots. Cold-rolled strip is firm at 2.85c., Cleveland and Pittsburgh.

Bolts, Nuts and Rivets.—Buyers are placing contracts quite freely for the first quarter, following the reaffirming of present prices for that delivery. With inventory time approaching, bolt and nut specifications have declined considerably. Rivets continue to move fairly well.

Coke.—Specifications for foundry coke are holding up fairly well for this time of the year, but very few consumers have as yet placed first quarter contracts. By-product foundry coke is unchanged at \$7.75, Painesville.

Old Material.—The market shows a firmer tone, and prices have advanced 25c. to 50c. a ton on heavy melting steel, machine shop turnings, blast furnace scrap and on some other grades. While there is little new consumer demand, mills are taking shipments rather freely and the price stiffening seems due to the demand from

dealers who have short orders. Dealers are holding for \$15.25 for No. 1 heavy melting steel, and there does not seem to be much available at a lower price. They are paying as high as \$11.75 for blast furnace scrap, or 25c. a ton above the recent maximum quotation. A Youngstown mill purchased a small tonnage of heavy melting steel at a reported \$18 price and dealers are offering \$17.50 to cover against this order.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$14.75 to \$15.25
No. 2 heavy melting steel.	14.25 to 14.75
Compressed sheet steel.	14.50 to 15.00

Rails for rolling.	16.25 to 16.50

Sheet Steel Shipments Dropped in November

Shipments of steel sheets fell off sharply during November, having been 307,790 tons, compared with 354,925 tons in October, according to the monthly report of the National Association of Flat Rolled Steel Manufacturers, Cleveland. The lessened demand evidently resulted from the curtailment in the automobile industry. However, production declined only slightly, having been 358,402 tons, compared with 369,243 tons during the previous month. Production exceeded shipments by slightly over 50,000 tons. While both shipments and production indicated a little slowing down in the industry, sales gained slightly during November. Unfilled orders on Dec. 1 were 40,000 tons larger than on Nov. 1. This increase seems due to the fact that, while shipments declined, there was a slight increase in sales. The November report and comparisons in net tons follow:

	Nov.	Oct.	Sept.
Total number of mills....	726	724	721
Capacity per month....	487,280	508,000	450,500
Percentage reporting....	70.2	70.2	70.1

New York

Bethlehem Steel Co. Announces First Quarter Prices on Plates, Shapes and Bars—Pig Iron Quiet

NEW YORK, Dec. 18.—Pig iron buying is adversely affected by the approach of the holidays. Bookings in this district for the week barely exceeded 5000 tons, and inquiries are fewer. Suspensions of shipments are rarely reported, however, and in some instances expedited deliveries are asked for. Indications point to sustained foundry melt, with holiday shutdowns held down to the minimum. Prices on Buffalo foundry iron range from \$17.50 to \$18, base furnace; eastern Pennsylvania producers quote \$19.50 to \$20, base furnace. The General Electric Co. has closed against at least part of its inquiry for 5500 tons for its Eastern plants. Another inquiry now current, for approximately 5000 tons for first quarter, calls for deliveries outside of this district. The New York Central is in the market for 200 tons of foundry, 50 tons of charcoal and 35 tons of silvery for shipment to Frankfort, N. Y., or Elkhart, Ind. The Delaware, Lackawanna & Western wants 150 tons of No. 2 plain and No. 2X for delivery at Scranton, Pa. Barge shipments of pig iron on the New York State barge canal, originating at Buffalo and points westward totaled 122,456 gross tons for the 1928 season of navigation.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75
to 2.25	\$22.41 to \$22.91
*Buf. No. 2, del'd east.	
N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil.	
1.75 to 2.25	20.89 to 22.52
East. Pa. No. 2X fdy., sil.	
2.25 to 2.75	21.39 to 23.02
East. Pa. No. 1X fdy., sil.	
2.75 to 3.25	21.89 to 23.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Ferroalloys.—Signs of a possible scarcity of spiegeleisen are discernible. The leading producer in this country has blown out one furnace for relining and another producer has made purchases of foreign alloy to fill contracts. One British producer is out of the export market for first quarter. Sales of about 300 tons of foreign spiegeleisen were made during the last week. Quotations for the domestic alloy are unchanged at \$34, furnace, for the 19 to 21 per cent alloy in carload lots. A few carloads of ferromanganese have been sold at \$105, seaboard basis, for delivery this month.

Plates, Shapes and Bars.—The Bethlehem Steel Co. surprised the trade late last week by an announcement of first quarter prices on these products, which in the case of plates and shapes at Eastern mill basing points are \$1 a ton below the levels which have recently been recognized as the market. The Bethlehem announcement puts plates and shapes at 2c. to 2.10c.,

Eastern basing points, or 2.17½c., New York, for plates and 2.14½c., New York, for shapes. Eastern plate mills had made a considerable number of first quarter contracts with regular customers at 2.22½c., New York, and a few at 2.27½c., New York, and the probability is that some of these will be rewritten to the new minimum base. Some large structural fabricators in the New York district are understood to have been getting prices below 2c., mill, but the majority of users have been paying 2.05c., and some small buyers have not been getting less than 2.10c. For shipment from the Cambria works, prices remain at 1.90c., Pittsburgh, for all three products, but Buffalo prices are \$1 a ton lower than those recently prevailing, the range now being 2c. to 2.10c., against 2.05c. to 2.10c. which had applied on a good deal of the fourth quarter business. The Bethlehem company amplifies its first announcement by saying that 2.14½c., New York, on shapes and 2.17½c., New York, on plates are the firm minimums "on the very largest tonnages," while prices on "customary tonnages" will be \$1 higher. December business has fallen off considerably. Many contract buyers did not specify their fourth quarter contracts in full by Dec. 15, which was the last day that some companies would accept specifications. Some contracts have been extended, but generally new first quarter contracts have been prepared and the old contracts cancelled.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.17½c. to 2.27½c.; struc. shapes, 2.14½c. to 2.24½c.; bar iron, 2.14c. to 2.24c.

Sheets and Strip.—Specifications against fourth quarter contracts for sheets and strip were fairly good, but were not as heavy as the trade expected in view of the fact that prices announced for first quarter are higher than those prevailing on expiring contracts. Sheet prices are holding, but producers of hot-rolled strips have not been able to get all that they set out to charge. The price for strips wider than 6 in. was to be 1.90c., Pittsburgh, for all but the very largest users and that for narrower strips, 2c., but nearly all contract buyers, large or small, have been able to cover at \$2 a ton under these prices.

Reinforcing Bars.—The Turner Construction Co. opened bids last week on the 8500 tons of bars for the Delaware, Lackawanna & Western terminal warehouse at Jersey City, and it is understood that the job will be placed this week among three or more distributors. The volume of pending work continues to increase, but the tonnage being placed is not large and there is little prospect for increased activity before the first of the year. Prices are unchanged.

Warehouse Business.—Thus far December has compared favorably with November in the volume of orders, but business is beginning to diminish as the holidays approach. Demand for black and galvanized sheets is light, and slight shading of prices is reported occasionally. Mild weather has contributed to a fairly active demand for structural material, and small orders for prompt delivery are being received by local warehouses.

pipe from public utility companies are beginning to appear and some tonnage has been closed. The American Construction & Securities Co., New York, is understood to have bought several thousand tons of water pipe and 10,000 to 15,000 tons of gas pipe for other companies is pending. Yonkers, N. Y., has closed for 300 tons of water pipe with a Birmingham maker. Quotations of Southern foundries are unchanged. Northern pipe makers show a tendency to advance prices on water pipe. On sales of gas pipe, the full \$4 to \$5 differential is not always applied and when sizable tonnages are involved the base price is sometimes slightly lower than on water pipe.

Prices per net ton deliv'd New York:
Water pipe, 6-in. and larger, \$39.60 to \$41.60; 4-in. and 5-in., \$44.60 to \$46.60; 3-in., \$54.60 to \$56.60; Class A and gas pipe, \$4 to \$5 extra.

Coke.—Demand for foundry and furnace coke is beginning to increase, but Connellsville prices are unchanged at \$3.50 to \$3.75 per net ton, ovens, for foundry and \$2.85 to \$3.05 per net ton, ovens, for furnace grade. The West Virginia producer of by-product foundry coke is renewing contracts for first half of next year at no change in price. By-product foundry coke is quoted at \$9 to \$9.40 per net ton, Newark or Jersey City, and \$10.06, New York or Brooklyn. Special brands of beehive coke are unchanged at \$4.85 per net ton, ovens, or \$8.56 per net ton, delivered to northern New Jersey, Jersey City and Newark, and \$9.44 to New York and Brooklyn.

New York Canal Shipments of Pig Iron 122,456 Tons

Total pig iron shipments from Buffalo and points westward through the New York State barge canal during the canal navigation season of 1928 were 122,456 gross tons, according to the Division of Canals and Waterways, Department of Public Works, Albany. The records of the department do not show what proportion of this tonnage originated at points other than Buffalo, but the pig iron trade understands that at least 30,000 tons of the total was shipped from Cleveland furnaces.

Smaller Production of Steel Barrels

WASHINGTON, Dec. 18.—Production of steel barrels in November totaled 563,647 units, or 48.8 per cent of operating capacity, against 656,021 barrels, or 56.4 per cent of capacity, in October, according to reports received by the Department of Commerce from 27 companies owning or operating 31 plants. Shipments were 568,353 and 661,009 barrels respectively, while stocks at the end of the months were 46,062 and 50,071 barrels respectively. Compared with last year, November showed a gain of 12½

Old Material.—Consumers of scrap still show little interest in making new contracts, but prices of all grades are strong and brokers are paying up to \$15.50 per ton for No. 1 steel, delivered on \$15.50 contracts with eastern Pennsylvania mills. Meanwhile, some heavy melting steel is being shipped to Midland, Pa., at \$17.50 per ton, delivered, or \$12.20 per ton, New York. A substantial tonnage of heavy melting steel is still being exported, principally to German ports, and during the present month a total of about 6000 tons is scheduled for export to German dealers.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.....	\$11.75 to \$12.25
Heavy melting steel (yard).....	8.50 to 9.50
No. 1 hvy. breakable cast.....	11.25 to 11.75
Stove plate (steel works).....	8.00 to 8.50
Locomotive grate bars.....	8.50
Machine shop turnings.....	7.25 to 7.50
Short shoveling turnings.....	7.25 to 7.50
Cast borings (blast furn. or steel works).....	6.75 to 7.00
Mixed borings and turnings.....	6.75 to 7.00
Steel car axles.....	17.00 to 17.50
Iron car axles.....	24.00 to 24.50
Iron and steel pipe (1 in. dia., not under 2 ft. long).....	10.75
Forge fire.....	8.00 to 8.50
No. 1 railroad wrought.....	12.25 to 12.75
No. 1 yard wrot., long.....	11.25 to 11.75
Rails for rolling.....	13.00 to 13.50
Cast iron carwheels.....	12.00 to 12.50
Stove plate (foundry).....	9.50
Malleable cast (railroad).....	10.00 to 10.50
Cast borings (chemical).....	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	\$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.).....	14.50

per cent in production and of 14 per cent in shipments.

Unfilled orders at the end of November, for delivery within 30 days, amounted to 319,699 barrels, compared with 301,782 barrels at the end of October. Unfilled orders at the end of November for delivery beyond 30 days were 631,798 barrels, compared with 522,090 barrels at the end of October.

Production during the 11 months ended November totaled 6,846,672 barrels, or 53.9 per cent of capacity, against 6,186,342 barrels, or 50.7 per cent of capacity, for the corresponding period of 1927. Shipments were 6,853,813 and 6,170,115 barrels respectively.

Bausch & Lomb to Offer Stock to Employees

The Bausch & Lomb Optical Co., Rochester, N. Y., has announced a plan whereby employees who have been with the company for two years or more may purchase stock in the company. The plan allows each employee to purchase preferred stock equivalent to one year's salary, on the deferred payment plan if necessary. The Bausch & Lomb organization has been a closed corporation for more than 75 years.

Pacific Coast

Diminishing Activity in Steel—Reinforcing Steel Awards in Week Total 1800 Tons

SAN FRANCISCO, Dec. 15 (*By Air Mail*).—With the approach of the holiday season and inventory taking period, activity in the Coast iron and steel markets is diminishing and few large tonnages are being placed. The greatest activity this week was in reinforcing steel, of which more than 1800 tons was booked, including 900 tons for an apartment in Los Angeles, 300 tons for a hotel at Bellingham, Wash., and 385 tons for an office building in Los Angeles.

Pig Iron.—Inquiries for and sales of foundry pig iron have not been heavy. Importations in September fell considerably below the August total. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil. 2.75 to 3.25		25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25		24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—The price situation on out-of-stock material in Los Angeles and San Francisco continues unsettled. While mild steel merchant bars in Los Angeles and here are firm at 2.30c., c.i.f., reinforcing bars continue to be quoted around 1.80c., base. A fair volume of new business is before the trade for figures, the largest inquiry calling for 300 tons for an opera building in San Francisco. Bids on 209 tons for a bridge at Tacoma have been postponed until after the first of the year.

Plates.—The Willamette Iron & Steel Works secured the largest plate award of the week, which was 250 tons for steel outlet pipes for the Diable Dam in Seattle. The Chicago Bridge & Iron Works took 129 tons for a steel tank at Lake Youngs, Wash., and 135 tons for tanks for three companies in Tacoma. The largest pending inquiry calls for 250 tons for a tank at San Rafael, bids on which will be opened Dec. 18. Plate prices continue firm at 2.25c., c.i.f. Imports of plates on the Coast in September totaled less than 100 tons, and the aggregate so far this year has been only 736 tons.

Shapes.—While fabricators are fairly busy figuring on new work, most of which involves small tonnages, actual bookings this week were

less than 500 tons. The Judson-Pacific Co. secured 100 tons for a shop at Tiburon, Cal., for the Northwestern Pacific, and the Herrick Iron Works took 150 tons for a packing plant in Oakland. Prices on plain structural shapes from domestic mills are firm at 2.35c., c.i.f., while around 1.60c., duty paid, c.i.f., can be obtained on foreign material.

Cast Iron Pipe.—A slight increase in demand for cast iron pipe is noted, and awards this week exceeded 900 tons. Henry Sacco, Seattle, was awarded 209 tons of 8 and 12-in. Classes B and C pipe for the improvement of West Holden Street, Seattle. Los Angeles placed 548 tons of 2 to

12-in. Class B pipe for the improvement of Arlington Street with Wilbur N. Edgley, Los Angeles. The American Cast Iron Pipe Co. took 194 of 4 to 10-in. Class B pipe for the improvement of Burbank Boulevard, Burbank, Cal. New inquiries include 1350 tons of 2 to 10-in. Class B pipe for the improvement of Lomita District No. 13, Los Angeles, bids on which will be opened Jan. 7. San Diego will open bids on Dec. 31 for 144 tons of 6 and 8-in. Class B pipe for the improvement of Catocin Drive, 103 tons of 2 to 6-in. Class B pipe for the improvement of Meade Avenue and 140 tons of 4 to 16-in. Class B pipe for the improvement of Taylor Street. That city is also asking for figures direct on 324 tons of 6-in. Classes B and C pipe. Imports of cast iron pipe for September totaled 1440 tons, compared with 2174 tons in August and 2301 tons in September, 1927.

St. Louis

Pig Iron Sold for Second Quarter—Demand for Sheets Keeps Mills at Full Rate

ST. LOUIS, Dec. 18.—The first sale of pig iron for second quarter delivery by the St. Louis Gas & Coke Corporation was made last week; it was 1000 tons of foundry iron to a machinery manufacturer at the price prevailing now. Other sales by this maker during the week, which was marked by quite a slump in buying, included 300 tons of malleable to an Illinois melter, 200 tons of foundry grades to a stove plant, and 100 tons to a Kansas City engine builder. The Granite City maker blew in its second furnace on Tuesday, having had it closed down for several months for relining and other repairs. Its shipments so far this month have averaged more than 400 tons a day in excess of those in the same month last year. Melters in the district are expected to be closed a shorter period than usual for the holidays on account of a heavy order file.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.		\$20.00
Granite City, Ill.		20.50
Malleable, f.o.b. Granite City		22.16
N'th'n No. 2 fdy., deliv'd St. Louis		20.92
Southern No. 2 fdy., deliv'd		22.16
Northern malleable, deliv'd		22.16
Northern basic, deliv'd		22.16

Freight rates: 81c. (average) Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—The buying of domestic coke has picked up considerably, and the demand of dealers outside of St. Louis has enabled local by-product ovens to reduce their stock piles. Colder weather also has resulted in much heavier buying by local dealers. Foundry coke business is good.

Finished Iron and Steel.—The Granite City Steel Co. is now operating at full capacity on black, galvanized and blue annealed sheets, the demand for

these items holding up remarkably well. There is a seasonal lull in the demand for tin plate, in which production is at about 80 per cent of capacity. Plates are dull, although demands from car builders are expected to be considerable after the first of the year. Business in structural steel fabrication is confined almost entirely to small jobs. The Missouri Highway Commission let highway contracts Friday which will require about 1000 tons of reinforcing bars.

Old Material.—The market for old materials is quiet, and there has been no buying of anything except a few specialties by the mills for several weeks, nor is there likely to be any buying movement until after the first of the year. However, the market is firm. No. 2 heavy melting and shoveling steel are 25c. higher, and machine shop turnings are 50c. higher.

Warehouse Prices, f.o.b. St. Louis

Base per Lb.

Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

The Abrasive Co., Philadelphia, manufacturer of grinding wheels and supplies, held its annual sales conference in that city, Dec. 3 to 5. The program, which was under the direction of S. M. Hershey, sales manager, included an inspection of the new factory at Bridesburg and a grinding demonstration in the company's mechanical laboratory.

New Extras on Wire Rods Announced Dec. 7

Extras on wire rods have been revised under date of Dec. 7. Compared with the former list, dated March 1, 1928, only the carbon extras have been changed, and in this case it is chiefly an extension of the range limits.

The list of extras follows:

	Extra per Gross Ton
Less than carload, but not less than 5 tons of a size.....	\$2.00
Less than carload and less than 5 tons of a size.....	4.00
Cleaned, line-coated and baked.....	2.50
Annealed	5.00
Screw stock	5.00
Special rods (low in all elements, not exceeding 0.30% in all impurities)...	20.00
CARBON EXTRAS	
When maximum of carbon range is 0.08%.....	3.00
When maximum of carbon range is reduced below 0.08%, add per point carbon	1.00
When maximum of carbon is 0.09 to 0.19%.....	Base
When minimum of carbon range is 0.20 to 0.40%.....	3.00
When minimum of carbon range is 0.41 to 0.55%.....	5.00
When minimum of carbon range is 0.56 to 0.75%.....	7.50
When minimum of carbon range is 0.76 to 0.90%.....	10.00
When minimum of carbon range is 0.91 to 1.00%.....	15.00

The above carbon extras to apply when other elements are in normal proportion.

A minimum carload of rods is 25 gross tons. When shipped in less than carload quantities the freight rate on wire applies.

HOT-ROLLED RODS STRAIGHTENED AND CUT IN 2 TO 24-FT. LENGTHS

No. 5 gage and heavier—25c. per 100 lb. extra to be added to base price of hot-rolled rods in coils reduced to 100 lb. basis.

Longer lengths than 24 ft. can be furnished, but at additional expense. The bar steel rate of freight is added to make a delivered price on straightened and cut rods either on carloads or less-than-carload lots.

Birmingham

Cast Iron Pipe Order for 24,000 Tons Awarded—Steel Business in Good Volume

BIRMINGHAM, Dec. 18.—Pig iron sales were light during the past week. This was not unexpected, in view of the heavy buying movement of the few weeks preceding, during which first quarter requirements were largely covered. Current sales are all spot, with orders ranging from 50 to 150 tons. One company is taking spot business at \$17, while the others quote \$16.50, base, for foundry iron. Shipments have eased off slightly owing to the usual holiday lull, but the strength they have shown for the month so far has been sufficient to reduce stocks to the low point of the year. Stocks on the yards of one company are equal to about three weeks make at the present rate. No changes in furnace operations have occurred during the past three weeks. Nine furnaces are on foundry, eight on basic, one on ferromanganese and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil..	\$16.50 to \$17.00
No. 1 fdy., 2.25 to 2.75 sil..	17.00 to 17.50
Basic	16.50

Finished Steel.—Prices on bars, plates and shapes are firm at 2.15c. Sheet demand is strong, with prices the same as for the past several weeks. Both inquiries and new business continue to develop at a good rate. Mills will begin the new year with better schedules than in any recent year. Structural steel fabricating shops are operating on full schedules, with a large tonnage in prospect. The Alabama State Bridge Corporation has placed contracts in this district for approximately 3680 tons of reinforcing bar steel. Open-hearth operations are the highest of the year, with the Tennessee company working

nine at Ensley, eight at Fairfield, and the Gulf States Steel Co. four at Alabama City.

Cast Iron Pipe.—The American Cast Iron Pipe Co. has been awarded a contract by Knoxville, Tenn., for 400 tons of cast iron pipe. The United States Cast Iron Pipe & Foundry Co. has received an order for 125 tons of 10-in. pipe for Memphis, Tenn. The Dallas, Tex., project requiring approximately 24,000 tons, reported in these columns last week, has been definitely awarded to this company. The only inquiry of consequence was for 3000 tons for Detroit. Gas line syndicates and water companies are estimating next year's requirements. Plants are securing a few small orders from day to day. Quotations are \$37 to \$38 on 6 in. and larger sizes.

Coke.—Demand for foundry coke is fair, in view of the large amount of first quarter coke under contract. No second quarter coke is being sold. Considerable coke is being shipped outside the district. Prices are unchanged.

Old Material.—Sales to foundries have been gradually easing up in the past two weeks owing to lighter operations and approaching inventories. Steel mills continue to take scrap in fairly good quantities.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel.....	\$12.50
Scrap steel rails.....	\$12.00 to 12.50
Short shoveling turnings..	8.00 to 8.50
Cast iron borings.....	8.00
Stove plate.....	13.50
Steel axles	19.00 to 20.00
Iron axles	21.00 to 22.00
No. 1 railroad wrought...	10.00 to 10.50
Rails for rolling.....	14.00 to 15.00
No. 1 cast	15.00
Tramcar wheels	13.00 to 14.00
Cast iron carwheels.....	13.00 to 13.50
Cast iron borings, chem...	13.50 to 14.00

Pearlitic Iron Castings to Be Made at Newark

The manufacture of pearlitic iron castings will be begun early next year at the plant of the Eastern Steel Castings, Newark, N. J., according to a statement of its president, W. D. Sargent, who has just returned from a visit to Germany.

While there he secured from the large German firms of Heinrich Lanz, Mannheim; A. Borsig, Berlin, Thyssen, Gelsenkirchen, and the Esslingen Machine Works, the American sales right for this process, which, it is understood, is now being extensively used abroad. Licenses have been reported given to 45 companies for the manufacture of this metal in Germany, England, France, Holland, Italy, Switzerland, Rumania, Denmark, Sweden and Japan. The product by this special process is known as "Perlite" castings.

Buffalo

Bethlehem Announces First Quarter Prices—Its Operations at Lackawanna Reduced to 60 Per Cent

BUFFALO, Dec. 18.—Only small orders for pig iron were booked by local furnaces during the past week. Most of the larger consumers are covered for the first quarter. It is estimated that not more than 20 per cent of the first quarter requirements is still to be purchased. The Bethlehem Steel Co. has taken off one blast furnace, reducing its active total from seven to six. Three other furnaces may go in before the first of the year or soon after—one Hanna, one Donner and the Tonawanda stack of the American Radiator Co.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	\$18.00 to \$18.50
No. 2X fdy., sil. 2.25 to 2.75	18.50 to 19.00
No. 1X fdy., sil. 2.75 to 3.25	19.50 to 20.00
Malleable sil. up to 2.25	18.50 to 19.00
Basic	17.50 to 18.00
Lake Superior charcoal	27.28

Finished Steel.—The Bethlehem Steel Co. has announced that first quarter prices for bars, shapes and plates will be 2c. to 2.10c., Lackawanna. The minimum presumably is to apply on contracts with large buyers, but it is a reduction of \$1 a ton from the prices at which many first quarter contracts had been made by other producers. Operations at the Lackawanna plant of the Bethlehem company have dropped during the past week to about 60 per cent; 15 of the 24 open-hearths are active. Some sizable structural projects are pending, including a new warehouse for the Cleveland & Buffalo Transit Co., but tonnage figures are not yet available.

Old Material.—The principal transaction of what otherwise was a light week was the purchase of 9000 to 10,000 tons of No. 1 machinery cast and stove plate at prices reported to be \$15 and \$14.50, respectively. This purchase will probably take the buyer out of the market for about two months on these commodities. One of the mills has suspended further shipments, and the chances are it will not resume until after the first of the year. The largest buyer is expected to come in shortly. There is considerable competition among dealers for No. 1 heavy melting steel, No. 2 heavy melting steel, hydraulic compressed sheets and machine shop turnings for Pittsburgh and Youngstown delivery. A very active demand exists for blast furnace scrap to apply on orders taken for delivery to local furnaces. A shortage exists for No. 1 heavy melting steel and it is likely

Warehouse Prices, f.o.b. Buffalo

Base per Lb.	
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.75c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	\$3.60
Black wire, base per 100 lb.	3.75

that the next large purchase will be at 50c. over present prices. Some sales of knuckles and couplers at prices ranging between \$17.50 and \$18.50 are reported.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	\$15.50 to \$16.50
No. 2 heavy melting steel	13.25 to 14.00
Scrap rails	15.50 to 16.00
Hydraul. comp. sheets	13.50
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	13.00 to 13.75
No. 1 busheling	14.50 to 15.50
Hvy. steel axle turnings	13.50 to 14.00
Machine shop turnings	7.50 to 8.00
No. 1 railroad wrought	12.50 to 13.00

Acid Open-Hearth Grades	
Knuckles and couplers	17.50 to 18.50
Coil and leaf springs	17.50 to 18.00
Rolled steel wheels	17.00 to 17.50
Low phos. billet and bloom ends	18.00 to 18.50

Electric Furnace Grades	
Short shov. steel turnings	11.00 to 11.50

Blast Furnace Grades	
Short shov. steel turnings	11.00 to 11.50
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 12.00
No. 2 busheling	9.00 to 9.50

Rolling Mill Grades	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00

Cupola Grades	
No. 1 machinery cast	15.00 to 15.50
Stove plate	14.50 to 14.75
Locomotive grate bars	13.00 to 13.50
Steel rails, 3 ft. and under	17.50 to 18.00
Cast iron carwheels	13.00 to 13.50

Malleable Grades	
Industrial	16.00 to 16.50
Railroad	16.00 to 16.50
Agricultural	16.00 to 16.50

Canada

Pig Iron Buyers Covering for First Quarter

TORONTO, ONT., Dec. 18.—Renewed interest has developed in pig iron. Advance contract placing was strongly featured in transactions of the week. First quarter business already closed is estimated at close to 20,000 tons, and inquiries are out for a still larger tonnage for shipment up to the end of March. Despite the fact that there has been considerable talk of higher prices, no advance has gone into effect. First quarter contracts are being closed at the same prices as on iron for immediate delivery.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	\$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.60
Malleable	23.60

Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	25.00
No. 2 fdy., sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00

Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Old Material.—Numerous inquiries are appearing for old material for delivery to the end of the year. Some first quarter buying also is reported, but so far only a few of the larger consumers have come into the market.

Heavy melting steel and turnings are moving freely to consumers in the Hamilton, Ont., district. Foundries are buying machinery cast, malleable scrap and stove plate more extensively. Montreal dealers report a stronger demand for wrought iron and steel axles, and there is also more demand for heavy melting steel for export. Toronto and Montreal prices are firm but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	\$9.50	\$7.00 to \$7.50
Rails, scrap	10.00	9.00
No. 1 wrought	9.00	11.00 to 11.50
Machine shop turnings	7.00	5.00
Boiler plate	7.00	6.00
Heavy axle turnings	7.50	6.50
Cast borings	7.50	5.00
Steel turnings	7.00	5.50
Wrought pipe	5.00	5.00
Steel axles	14.00	20.00
Axles, wrought iron	16.00	22.00
No. 1 machinery cast	16.00 to	17.00
Stove plate		13.00
Standard carwheels		16.00
Malleable		13.00

Per Net Ton

No. 1 machinery cast	15.00	
Stove plate	9.00	
Standard carwheels	13.00	
Malleable scrap	13.00	

Detroit

December Lull Becomes More Pronounced

DETROIT, Dec. 18.—The December lull becomes very pronounced, as indicated by a falling off last week of 3473 in the labor barometer of the Detroit Employers' Association. Previous to last week, the weekly decrease was only about 2500. This condition is usual for this time of year, and is due largely to inventory taking and readjustments for new models.

The Ford Motor Co., during the first year of manufacture of the new model, has sold 704,699 units. The first week of this month showed a daily production of 6435 units, an increase of 400 units a day over the first week of November. Total November production was 121,037 cars and trucks. The estimates for 1929 production are being based on a record of 2,100,000, the 1924 peak. At least 1,800,000 cars and trucks are expected to be sold in the United States and Canada.

The scrap market has shown a slightly stronger tone during the past week, with heavy melting and shoveling steel and hydraulic compressed registering advances of 50c. per ton.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$13.50 to \$14.00
Borings and short turnings	9.00 to 9.50
Long turnings	8.50 to 9.00
No. 1 machinery cast	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets	12.75 to 13.25
Stove plate	11.00 to 12.00
No. 1 busheling	11.00 to 11.50
Sheet clippings	8.00 to 8.50
Flashings	11.50 to 12.00

Boston

Good Cast Iron Pipe Business Is in the Making—Buffalo Iron Prices Mixed

BOSTON, Dec. 18.—Pig iron sales in this territory the past week were the smallest for any similar period in months. The largest sales by any furnace were less than 3200 tons. In the aggregate, bookings did not run more than 4500 tons. A Vermont foundry, inquiring for 1000 tons No. 2X first quarter iron, withdrew from the market. The Buffalo price situation is mixed. Most of the furnaces in that district are holding to \$18 a ton, furnace, for No. 2 plain and \$18.50 a ton for No. 2X. One stack, however, has accepted and is soliciting business at \$17.50 a ton, base furnace, and within the last day or two another furnace has solicited business on the same base, but so far as known has made no bookings. Buffalo No. 1X iron is openly quoted at \$19.50 a ton on cars furnace, but offers of \$19 have been common of late. Requests for deferred shipments on contract iron so far this month have been fewer than in any December for many years.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$22.41 to \$22.91
*Buffalo, sil. 2.25 to 2.75..	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25..	24.15 to 24.65
East. Penn., sil. 2.25 to 2.75..	24.65 to 25.15
Va., sil. 1.75 to 2.25.....	26.91
Va., sil. 2.25 to 2.75.....	27.41
Ala., sil. 1.75 to 2.25.....	23.41 to 25.77
Ala., sil. 2.25 to 2.75.....	23.91 to 26.27

Freight rates: \$4.91 all rail from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate.

Coke.—New England by-product coke makers have not only caught up with contract specifications, but are pushing foundries for anticipated wants. Melters, however, are specifying only as requirements necessi-

tate. Indications are New England foundries will go into 1929 with more business on their books than on Jan. 1 in any recent year. Foundry coke remains at \$11 a ton, delivered within a \$3.10 freight rate zone.

Cast Iron Pipe.—The outlook for pipe business before Jan. 1 is bright. One of the largest New England utility companies is inquiring for 4000 tons, and it is expected at least two and possibly three others will place substantial tonnages this month. Salem, Mass., has awarded 100 tons of 12-in. pipe to the National Cast Iron Pipe Co., the first New England business placed with an Alabama foundry since early in 1928. New Bedford, Mass., has placed 100 tons of pipe with the United States Cast Iron Pipe & Foundry Co. Kingston, Mass., has yet to close on 200 tons. Private business is exceptionally good for December. Boston will close bids at noon, Dec. 26, on 2000 tons of pipe, consisting of 1000 8-in., Class B, 150 tons of 10-in., 500 tons of 12-in., and 350 tons of 16-in. The city is also calling for bids on 30 tons of special 24-in. to 48-in. castings and approximately 668 tons of various water department castings. Prices quoted openly on pipe are: 4-in., \$47.10 to \$48.10 a ton, delivered common Boston freight rate points; 6-in. and larger, \$44.10 to \$45.10. Differentials of \$3 and \$4 a ton are asked on Class A and gas pipe.

Fabricated Steel.—The fabricated steel market is quiet. The outlook is encouraging, however. Approximately 6000 tons of steel has been figured and several 1000 and 2000-ton jobs will come up for bids within the next fortnight.

Warehouse Business.—In addition to the recent advance of \$2 a ton in local warehouse prices on wire nails, a similar rise is noted on other wire

products, such as barbed wire, cable, staples, etc. Instead of curtailing business, the new prices have bolstered up buying. Bars, structural steel, plates, bands and kindred mill products have moved out of warehouses so far this month in much larger volume than a year ago. Further, there is comparatively little price cutting, except with preferred customers and on moderately large contracts.

Old Material.—Higher scrap prices in the Pittsburgh territory are reflected here. The movement of material out of New England is somewhat larger than a week ago. The market is by no means active, however. Quite an improvement in forge scrap values is noted, and this material is leading in activity. Early in the week, sales at \$7.50 a ton, on cars shipping point, were reported; since then sales at \$8 to \$8.50 a ton have been made. Most current business in mixed borings and turnings is at \$6 a ton, on cars, but occasionally brokers add 5c. or 10c. a ton. The market for heavy melting steel and steel mill borings is easily 25c. a ton higher, and rails for re-rolling are up 50c. a ton on limited transactions. Railroad wrought is quoted higher, yet there appears to be little sale for the material. Scattering sales of axles are reported at former prices.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel..	\$11.00 to \$11.50
Scrap T rails.....	10.50 to 11.00
Scrap girder rails.....	10.00 to 10.25
No. 1 railroad wrought....	11.50 to 12.00
No. 1 yard wrought.....	9.00 to 9.50
Machine shop turnings....	6.25 to 6.50
Cast iron borings (steel works and rolling mill)...	6.00 to 6.25
Bundled skeleton, long....	9.00 to 9.25
Forge flashings.....	9.00 to 9.50
Blast furnace borings and turnings	5.75 to 6.10
Forge scrap	7.50 to 8.00
Shafting	13.00 to 13.50
Steel car axles	16.00 to 16.50
Wrought pipe 1 in. in diameter (over 2 ft. long) ..	9.50 to 10.00
Rails for rolling.....	11.50 to 12.00
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	\$14.00 to \$14.50
No. 1 machinery cast.....	15.00 to 15.50
No. 2 machinery cast.....	13.00 to 13.50
Stove plate	11.00 to 11.50
Railroad malleable	15.50 to 15.75

Wrought Iron Co. Formed; Charles Hart, President

The Wrought Iron Co. of America, embracing the Lebanon Iron Co., Lebanon, Pa., and the Scranton Bolt & Nut Co., Scranton, Pa., merger of which was announced last August, has been incorporated under the laws of Pennsylvania. Authorized capital stock of the new company is 1,250,000 shares of 7 per cent cumulative preferred stock with \$100 par value and 265,000 shares of common stock of no par value.

The president of the new company is Charles Hart, who is also president of the Delaware River Steel Co., Chester, Pa. On the board of directors are: A. A. Corey, Jr., Vanadium Corporation of America; Burrows

Sloan, president General Refractories Co.; Charles P. Lineweaver, vice-president Bank of North America & Trust Co., Philadelphia; Frank Hummler, Scranton National Bank, Scranton, Pa.; Howard Longstreth, formerly president Lebanon Iron Co.; Thomas D. Smith, Harrison, Smith & Co., bankers, Philadelphia; T. H. McKoy, Jr., Kidder, Peabody & Co., New York, and C. B. Hibbard.

Wide grooves, giving large chip area, and shearing cut, with graduated taper, are features of a spiral three-groove structural reamer which has been placed on the market by the Morse Twist Drill & Machine Co., New Bedford, Mass. The tool is designed for service under difficult conditions.

Cincinnati

Advance on Tennessee Pig Iron Does Not Hold—Sheet Mills Busy—Scrap Strengthens

CINCINNATI, Dec. 18.—After advancing its price to \$17, base Birmingham, a week ago, a Tennessee melter again is soliciting business at \$16.50. The reestablishment of the former schedule came as a result of the failure of Alabama producers, with one exception, to raise their prices above \$16.50. Local brokers have participated in the market to the greatest extent in several years. They have been active in selling small lots of Valley iron to Ohio and Indiana consumers and also have purchased practically all of the remaining stock of the Marting Iron & Steel Co., Iron-ton, Ohio. They are reselling the southern Ohio iron at \$18.50 to \$19, base furnace, an advance of 50c. a ton from previous quotations. Northern Ohio furnaces have such substantial order books that they are reported to be inactive so far as the solicitation of fresh orders in this territory is concerned. Sales in the past week have amounted to about 4000 tons. Bookings included 1000 tons of Northern foundry for a Kokomo, Ind., company, 1000 tons for a central Ohio melter and 500 tons for a Hamilton, Ohio, user.

Prices per gross ton, deliv'd Cincinnati:
So. Ohio fdy., sil. 1.75 to 2.25 \$20.39 to \$20.89
Ala. fdy., sil. 1.75 to 2.25... 20.19 to 20.69
Ala. fdy., sil. 2.25 to 2.75... 20.69 to 21.19
Tenn. fdy., sil. 1.75 to 2.25 20.19
S'th'n Ohio silvery, 8 per cent 27.89 to 28.89

Freight rates, \$1.89 from Iron-ton and Jackson, Ohio; \$3.69 from Birmingham.

Coke. — Movement of by-product foundry coke has held up surprisingly well this month, but a considerable decrease in shipments is expected during the remainder of December on account of the approaching inventory period. Despite unfavorable weather, domestic grades have been in fair demand. While no announcement has been made by district makers, by-product foundry coke probably will remain at \$7, ovens, during January, whereas all domestic sizes will go up 50c. a ton. A local dealer has closed an order with a Wisconsin melter for

6000 tons of Wise County beehive foundry coke to be delivered during the first half of next year.

Finished Material. — Sheet steel specifications have continued in liberal volume and have been sufficiently diversified to insure operation of district mills at 100 per cent of capacity during the remainder of the year. Demand from automobile makers has picked up somewhat and a further increase in bookings from the Detroit district is expected the coming week. Jobbers have been taking moderate tonnages of sheets, while electrical equipment manufacturers have been buying freely. In the South, the roofing season has been fairly good, although considerable price shading on galvanized sheets is reported. The new schedule of quotations is holding well, with blue annealed selling at 2.10c., base Pittsburgh, black at 2.85c., galvanized at 3.60c. and automobile body sheets at 4.10c. Common wire nails have gone up \$2 a ton and now are quoted at \$2.79 per keg, delivered Cincinnati, or \$2.65, Iron-ton. Bars, shapes and plates are steady

at 1.90c. to 2c., base Pittsburgh, but sales have been light.

Old Material.—The scrap market has an underlying tone of strength, which has had a stimulating effect on prices. Heavy melting steel has advanced 25c. a ton, and cast iron borings and machine shop turnings are also higher than a week ago. Increased demand for malleable scrap has forced dealers to pay 50c. a ton more for railroad and agricultural malleable. Railroads are reported to have obtained from 25c. to 45c. a ton more for their material this month than in November. While users are buying little at the moment, inquiries are plentiful and indications are that the market will be active immediately after the turn of the year.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.25 to \$13.75
Scrap rails for melting....	13.25 to 13.75
Loose sheet clippings.....	9.50 to 10.00
Bundled sheets	10.25 to 10.75
Cast iron borings.....	9.75 to 10.25
Machine shop turnings....	9.00 to 9.50
No. 1 busheling.....	11.00 to 11.50
No. 2 busheling.....	7.00 to 7.50
Rails for rolling.....	14.00 to 14.50
No. 1 locomotive tires....	14.00 to 14.50
No. 2 railroad wrought....	13.25 to 13.75
Short rails	19.00 to 19.50
Cast iron carwheels.....	12.50 to 13.00
No. 1 machinery cast.....	18.50 to 19.00
No. 1 railroad cast.....	15.00 to 15.50
Burnt cast	10.00 to 10.50
Stove plate	10.00 to 10.50
Brake shoes	10.25 to 10.75
Railroad malleable	14.75 to 15.25
Agricultural malleable....	13.75 to 14.25

Germany to Export Steel Houses

HAMBURG, GERMANY, Dec. 1.—A company is being formed in Germany to export steel houses. The staff of the new export organization will include engineers familiar with steel dwellings of all types and able to advise foreign buyers as to the most satisfactory design for their purposes.

Cast Iron Pipe Freight Rates Justified

WASHINGTON, Dec. 18.—Passing upon a complaint of the Krupp Foundry Co., Lansdale, Pa., Attorney-Examiner Howell, in a proposed report announced today, recommended that the Interstate Commerce Commission find that rates on cast iron pipe, in carloads, from Lansdale and Quakertown, Pa., to New York Harbor and northern New Jersey stations are not unreasonable. Dismissal of the complaint was proposed. The rates to New York and Jersey City are \$1.70 and \$1.80 per net ton, respectively.

Tutein-Hudson Valley Case Begun and Postponed

Hearings in the arbitration proceedings between E. Arthur Tutein, Inc., Boston, and the Hudson Valley Coke & Products Corporation, Troy, N. Y., involving an alleged breach of contract for the sale of pig iron and coke, were begun on Monday, Dec. 17, in the trial room of the

New York Bar Association's building at 42 West Forty-fourth Street, continued for one day and then were postponed until Dec. 26 because United States Senator Wagner, arbitrator for the Hudson Valley company, announced that he must go to Washington to attend the sessions of the Senate. Sherman Whipple, Boston, is arbitrator for E. Arthur Tutein, Inc., and the third arbitrator, appointed by Charles M. Schwab, as president of the American Iron and Steel Institute, is Louis K. Comstock of New York.

Duff Mfg. Co. Acquires A. O. Norton, Inc.

The Duff Mfg. Co., Pittsburgh, has acquired the business and assets of A. O. Norton, Inc., Moline, Ill., and its Canadian subsidiary, A. O. Norton, Inc. Both companies are in the manufacture of industrial and railroad jacks and have a substantial drop forgings business. A new company, the Duff-Norton Mfg. Co., has been formed with former Duff company officials holding the principal offices.

Czechoslovakia Keeps Machinery on Free List

HAMBURG, GERMANY, Dec. 1.—The Czechoslovakian list of duty-free machines has been extended to the end of 1929, except for tractors, which are reported to be produced in sufficient numbers domestically to satisfy present requirements.

Non-Ferrous Metal Markets

Copper Firm and Quiet, Tin Moderately Active and Easy, Lead and Zinc Steady with Sales Light

NEW YORK, Dec. 18.

Copper.—Because of a desire to keep down stocks and also because of the approach of inventories, domestic consumers are not active buyers. However, there have been some good purchases the past week, the largest having been 1400 net tons by the Western Union Telegraph Co. Most of the buying is for February delivery with a little for March and some for January. Foreign buying has been light and it is estimated that consumers abroad must still buy about two-fifths of their January and four-

*Refinery quotation; delivered price ¼c. higher.

fifths of their February requirements. Prices continue very firm at 16c., delivered in the Connecticut Valley, and 16.25c., c.i.f. usual European ports, for electrolytic copper. No changes in these prices are indicated for the immediate future. Production has increased considerably and statistics for November show that stocks of copper, in the refined and blister condition, increased about 10,000 tons over October, with about 6500 tons of this in the refined form. Specifications on contract are reported exceedingly heavy, with all December metal being regularly taken. Demand for Lake copper is satisfactory with prices firm at 16c. to 16.12½c., delivered.

Tin.—In a quiet market, sales of Straits tin amounted to about 1000 tons for the week ended Saturday, Dec. 15. Purchases were confined to nearby or December-January delivery,

with consumers taking about one-half of the total. As is usual at this time of the year, the market is becoming quieter and thus far this week very little business is reported. Today spots Straits tin was quoted at 49.62½c., New York, and prices in London were somewhat lower than a week ago, with spot standard quoted at £224 17s. 6d., future standard at £223 17s. 6d., and spot Straits at £225. The Singapore market today was £226 15s.

Lead.—Following the heavy buying recently, the market has turned quiet, but sales in the last two days have been fairly substantial at the firm price of 6.35c. St. Louis. The deliveries involved have been mostly January, with some December metal, but sales for February have been very light. Producers are in a very comfortable position and are not in-

Non-Ferrous Rolled Products

Brass and copper mill prices have not changed since Oct. 29. Zinc sheets have been quoted at 9.75c., base, since July 30, and lead full sheets at 10.25c. to 10.50c. since Nov. 15.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—	
High brass	20.50c.
Copper, hot rolled	25.00c.
Zinc	9.75c.
Lead (full sheets).....	10.25c. to 10.50c.

Seamless Tubes—

Brazed Brass Tubes.....	28.50c.	

clined to force the market. The contract price of the American Smelting & Refining Co. is unchanged at 6.50c., New York.

Zinc.—Purchasing of prime Western was so heavy in November that producers are in a somewhat independent position so that, with demand rather light at present, quotations continue decidedly firm at 6.35c., East St. Louis, or 6.70c., New York, for delivery through the first quarter. Consumers, however, have considerable metal yet to buy for that period. Interest in the ore market continues unabated, with the ore price unchanged at \$40, Joplin. Stocks were further reduced last week by about 5500 tons, with the total now estimated at about 38,600 tons. On Nov. 3 stocks were a little over 57,800 tons. Ore output is being curtailed, the estimate for last week being about 12,500 tons, with sales at 13,320 tons and shipments at a little over 17,900 tons. The last two items were a little less than the preceding week, but are regarded as impressive.

Antimony.—Demand for Chinese metal is light, but quotations are a little higher at 9.87½c., duty paid, New York, for all positions.

Nickel.—Wholesale lots of ingot and shot nickel for this and next year's delivery are unchanged at 35c. and 36c., respectively. Electrolytic nickel is held at 37c. for this year's delivery, but for 1929 the quotation will be on the same basis as for ingot and shot nickel.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Markets at Chicago

CHICAGO, Dec. 18.—This market is quiet, with prices unchanged except for tin. Specifications for all grades are lighter. The old-metal market is without feature.

Prices, per lb., in carload lots: Lake copper, 16.25c.; tin, 50.50c.; lead, 6.45c.; zinc, 6.45c.; in less-than-carload lots: antimony, 10.75c. On old metals we quote copper wire, crucible shapes and copper clips, 12.50c.; copper bottoms, 11.25c.; red brass, 10.75c.; yellow brass, 8.25c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 27c.; tin foil, 27c.; block tin, 39c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

New Steel Corporation Directors Elected

At a meeting of the board of directors of the United States Steel Corporation held on Dec. 18, Junius S. Morgan, Jr., of J. P. Morgan & Co., and Walter S. Gifford, president of the American Telephone & Telegraph Co., were made directors of the corporation succeeding the late William P. Palmer and John S. Phipps, who has retired. Thomas W. Lamont, who was elected to the board earlier in the year, was made a member of the finance committee.

Railroad Equipment

Boston & Maine Orders 500 Hopper Cars

OUTSTANDING orders placed during the week were 500 hopper cars for the Boston & Maine, 200 automobile cars for the Chicago & Eastern Illinois and 200 composite gondola cars for the Great Northern. The Louisville & Nashville has placed 24 locomotives. Inquiries included 250 gondola cars for the Elgin, Joliet & Eastern. Details of the week's business follow:

Boston & Maine has ordered 500 steel hopper cars from Standard Steel Car Co.

Chicago & Eastern Illinois has ordered 200 automobile cars from Mount Vernon Car & Mfg. Co.

Great Northern has ordered 200 composite gondola cars from Pressed Steel Car Co. and six dining cars from Pullman Car & Mfg. Corporation, and is inquiring for six gas-electric cars.

Fruit Growers Express has ordered 196 refrigerator car underframes from Ryan Car Co. This company has yet to pur-

chase 800 underframes through its subsidiary, Western Fruit Express.

Pacific Fruit Express has ordered 600 refrigerator car underframes from Pacific Car & Foundry Co.

Akron, Canton & Youngstown has ordered four air-dump cars from Magor Car Corporation.

International Railways of Central America are inquiring for 25 stock cars.

United Fruit Co. has ordered 50 cane cars from Magor Car Corporation.

Elgin, Joliet & Eastern is inquiring for 250 70-ton gondola cars and 75 flat car bodies.

Chicago, South Shore and South Bend has ordered two caboose cars from American Car & Foundry Co.

New York Central is inquiring for 22 steel coaches, five steel observation coaches and four smoking cars, all 70 ft. long.

Chicago & North Western is inquiring for 10 70-ft. baggage cars.

Louisville & Nashville has ordered 24 locomotives from Baldwin Locomotive Works.

Chicago, Rock Island & Pacific is now asking for eight gas-electric cars instead of six.

Reinforcing Steel

Awards of 4400 Tons—3650 Tons in New Projects

AWARDS of 4400 tons, reported to THE IRON AGE in the last week, included no jobs of outstanding size. Among the projects to take 3650 tons were a group of State hospital buildings at Orangeburg, N. Y., which will require 1000 tons. Awards follow:

NEW YORK, 400 tons, subway section 4, route 106; from Slattery-Baino & Co., general contractors, to National Bridge Works.

PHILADELPHIA, 500 tons, warehouse at Sixth Street and Glenwood Avenue, to American Steel Engineering Co.

AKRON, OHIO, 400 tons, Goodyear-Zepelin Co. hangar, to Hardware & Supply Co., West Virginia Rail Co. to furnish the steel.

OAK PARK, ILL., 100 tons, school, to Concrete Steel Co.

CHICAGO, 400 tons, apartment building, to Concrete Steel Co.

CHICAGO, 100 tons, Harlem Avenue bridge, to Concrete Engineering Co.

CHICAGO, 250 tons, apartment building near Loyola Station, to Concrete Engineering Co.

CHICAGO, 100 tons, naval armory, to Concrete Engineering Co.

CHICAGO, 125 tons, Jorgenson apartments, to Concrete Engineering Co.

CHICAGO, 100 tons, Nurses' Home for city of Chicago, to Concrete Engineering Co.

BELLINGHAM, WASH., 300 tons, hotel, to Northwest Steel Rolling Mills.

SACRAMENTO, CAL., 188 tons, crossing at Benham, to unnamed interest.

LOS ANGELES, 385 tons, office building, Eighth and Hill Streets, to unnamed interest.

LOS ANGELES, 900 tons, apartment building, 414 North Rossmore Boulevard, to unnamed interest.

LOS ANGELES, 120 tons, hospital, Glendale Boulevard, to unnamed interest.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 250 tons, New York State Hospital building.

ORANGEBURG, N. Y., 1000 tons, several buildings for New York State Hospital; Niewenhaus Co., general contractor.

JERSEY CITY, 150 tons, Margaret Maternity Hospital.

WEST NEW YORK, N. J., 100 tons, manufacturing building for Brinkerhoff Electric Co.; Auf-Der-Heide Construction Co., general contractor.

DOVER, N. J., 240 tons, buildings for Picatinny Arsenal; bids in.

APPLE CREEK, OHIO, 200 tons, buildings for the Ohio Institute for Feeble Minded.

CINCINNATI, 144 tons, library at University of Cincinnati.

CINCINNATI, 200 tons, Loretta Guild.

HAMILTON, OHIO, 193 tons, Hamilton High School.

WOLF POINT, MONT., 121 tons, Missouri River bridge; bids Dec. 19.

TACOMA, WASH., 209 tons, Tacoma Avenue bridge; bids postponed.

SAN FRANCISCO, 300 tons, foundations for War Memorial; bids Jan. 5.

LOS ANGELES, 160 tons, apartment building, South Detroit Street; bids being received.

LOS ANGELES, 190 tons, apartment building, Occidental Avenue; bids being taken.

SAN FRANCISCO, 191 tons, paving Laguna Honda Boulevard; bids Dec. 26.

PERSONAL

H. A. HOUSTON has been appointed works manager of the R. D. Nuttall Co., Pittsburgh, maker of Westinghouse-Nuttall gears, and a subsidiary of the Westinghouse Electric & Mfg. Co. Mr. Houston is a graduate in mechanical engineering of Purdue University, and a post-graduate of the railroad department of the University of Illinois. Before joining the Westinghouse company he had been engaged in mechanical and engineering capacities with the St. Louis-San Francisco and the Chicago, Rock Island & Pacific railroads. Since 1920 he has been manager of mechanical parts, railroad equipment engineering department, Westinghouse company. During the World War, he was a major in the Engineers Corps.

HERBERT C. RYDING, vice-president Tennessee Coal, Iron & Railroad Co., Birmingham, has been elected president of the recently organized Birmingham Board of Industrial Development.

JOHN E. KELLEY, general sales manager Simonds Saw & Steel Co., Fitchburg, Mass., will retire from that position on Dec. 31, after an association of 33 years with the company. He began as a salesman and was later advanced to branch manager and finally general sales manager and secretary. At present Mr. Kelley plans a rest at his Florida home, 740 Beach Drive, St. Petersburg.

W. E. LEWIS, recently resident manager at the Anniston, Ala., plant of the United States Cast Iron Pipe & Foundry Co., has been made resident manager for the company at Addyston, Ohio, succeeding the late CHARLES SEITZ.

C. E. FOUST, vice-president and general sales manager of the Kentucky Fire Brick Co., Chicago, has been appointed representative of the Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa., in the Chicago district, with headquarters at 208 South La-Salle Street.

F. J. PHILLIPS, for several years with the Concrete Steel Co. at Boston, is representing the General Fireproofing Co., Youngstown, in the Philadelphia territory.

HENRY C. OSBORN, president American Multigraph Co., Cleveland, has been appointed chief of the Cleveland Ordnance District of the United States Army, succeeding COL. FRANK A. SCOTT, chairman of the board of the Warner & Swasey Co., who recently resigned. ALEX C. BROWN, president Industrial Brownhoist Corporation, Cleveland, has been made assistant ordnance chief of the district. Colonel

Scott has been appointed on Mr. Osborn's advisory committee, which also includes SAMUEL MATHER, chairman, and HENRY G. DALTON, both of Pickands, Mather & Co., JAMES A. CAMPBELL, president Youngstown Sheet & Tube Co. and ALLYN F. HARVEY, president Pittsburgh Steamship Co.

WILLIAM W. SWAYZE, formerly plant manager for the American Manganese Steel Co., New Castle, Del., and previously associated with the Taylor-Wharton Iron & Steel Co., High Bridge, N. J., has been made superintendent of the Deemer Steel Casting Co., New Castle, Del. After Jan. 1 the Deemer company will be

W. W. SWAYZE

equipped to manufacture manganese steel castings and will continue its production of carbon-and alloy steel castings as heretofore.

F. H. BUTTERFIELD has been appointed chief engineer of the Laclede Steel Co., St. Louis, succeeding H. H. WOOD, who has resigned.

HARRY SCULLIN, president Scullin Steel Co., St. Louis, and EARL C. BROWN, vice-president and general manager Mississippi Valley Structural Steel Co., St. Louis, have been elected to the board of directors of the Merchants and Manufacturers Association of that city.

H. J. KELLEY, for five years general manager of steel plants for the British Empire Steel Corporation, Ltd., Sydney, N. S., and previously associated for many years with the Lackawanna Steel Co., Buffalo, has been appointed general manager of the British Empire corporation, with headquarters at Sydney. He will be in charge of all the company's activities, including coal mines, railroads,

docks and steamships, and succeed J. E. McLURG, vice-president, who has been transferred to the Montreal office. F. W. GRAY, for five years assistant to the president, with headquarters at Montreal, who has been in the service of the company for 24 years, has been appointed assistant general manager, with office at Sydney.

CHARLES L. RICE, manager Hawthorne works, Western Electric Co., Inc., Chicago; WILLIAM H. MEESE, manager of the company's Point Breeze plant, Baltimore, and S. S. HOLMES, of the Kearny works, Kearny, N. J., have been elected vice-presidents of the company.

M. H. LUND, Middletown, Ohio, will be in charge of a foreign office to be opened on Jan. 1 at Oslo, Norway, by the Bureau of Foreign and Domestic Commerce, Department of Commerce.

LEROY P. ROBINSON, New England representative of the Sterling Wheelbarrow Co., Milwaukee, has resigned to become sales manager of the Werner G. Smith Co., Cleveland. He will be succeeded by RAY HUNTER, for many years with White & Brother, Inc., Philadelphia, and the Niagara Falls Smelting & Refining Co. Mr. Hunter will retain his association with the White organization.

D. C. CURTIS, purchasing agent for the Chicago, Milwaukee, St. Paul & Pacific railroad, was the guest of the New England Railroad Club on Dec. 11, at Boston, and discussed the budget system in railroad administration.

H. M. LANE, president of the H. M. Lane Co., Detroit, was the guest of the New England Foundrymen's Association at the Exchange Club, Boston, on Dec. 12. He discussed recent improvements in melting of iron, his talk being accompanied by illustrations. Later he exhibited sample castings and told of methods employed in making them and results obtained in stress, machinability, etc. At a business meeting preceding Mr. Lane's address, H. P. BLUMENAUER, Arcade Malleable Iron Co., Worcester, Mass.; HENRY S. CHAFFEE, Builders Iron Foundry, Providence, R. I., and R. F. HARRINGTON, Hunt-Spiller Mfg. Corporation, South Boston, were appointed to a nominating committee for officers to be elected at the association's annual meeting on Jan. 9. CHARLES A. REED, Rogers, Brown & Crocker Brothers, Inc., Boston, was made chairman of the entertainment committee for the annual meeting. The association, cooperating with the Associated Brass Founders of New England, voted to tender a dinner on Dec. 19, at the Engineer's Club, to LEROY P. ROBINSON, Sterling Wheelbarrow Co., Boston, who is to locate shortly in Cleveland.

Obituary

WILLIAM CHASE GREENE, vice-president and works manager of the Builders Iron Foundry, Providence, R. I., died in that city on Dec. 13, following a long illness. He was born at Marietta, Ga., Dec. 16, 1852.

EDWARD PRESTON CLIFFORD, vice-president Bell Telephone Laboratories, Inc., New York, died at his home in that city on Dec. 17, aged 53 years. He became associated with the Western Electric Co., Inc., 35 years ago and in 1911 was made manager of the New York office. In 1917 he became Eastern district manager, and the following year, office manager of the company's engineering department. When the Bell Telephone Laboratories were incorporated in 1925 he was elected vice-president.

GEORGE F. HUTCHINS, for many years general superintendent of the Crompton & Knowles Loom Works, Worcester, Mass., died Dec. 12, aged 87 years. He was widely known as a mechanic and as an inventor in the development of weaving, particularly in connection with the fancy loom. He was born at Hepburn, Pa., but later moved to East Douglas, Mass., and learned his trade in the works of the Douglas Axe Co.

OTTO J. DORN, manager of the Automatic Sprinkler Co., Chicago, died suddenly Dec. 12 at his office in that city, aged 65 years.

Chrome-Tungsten Steel Excellent at High Temperatures

(Concluded from page 1556)

in. in 400 hr. but remained substantially constant at that figure after 600 hr.

L. W. Spring, Crane Co., Chicago, confirmed the good report on this steel by describing his "long-draw" tests. He places round samples in drilled holes in a cast iron block, and heats them continuously at 900 deg. Fahr., testing them for hardness at given intervals, and inferring a change in related properties from the change in hardness. An 8 per cent chromium, 8 per cent tungsten steel with 0.60 per cent carbon gave 590 Brinell when quenched. After 300 hr. at 900 deg. Fahr. the Brinell increased to 630, which figure was maintained for 1800 hr. more, then it gradually fell to 510 after a total time of 2900 hr. (4 months).

The same alloy with 0.30 per cent carbon acted similarly, but the decrease in hardness started 500 hr. earlier, and it fell faster. Mr. Spring thought that White and Clark neglected high-speed steel, which gives good high-temperature service. No decrease in hardness occurs after 2100 hr. at 900 deg. C. Also he cited the austenitic steels containing 24 per cent nickel and 7 to 17 per cent chro-

mium which will not creep more than 1 per cent in one year at working loads and temperatures. It should also be remembered that large grain size is probably desirable for steels for this duty, despite the fact that fine grain is associated with toughness at atmospheric temperatures. In other words, a casting may resist loads better than a forging at and above 900 deg. Fahr.

Milwaukee Forms Chapter of Welding Society

Temporary organization of a Milwaukee chapter of the American Welding Society has been effected through the efforts of S. H. Smith, manager Milwaukee branch Universal Oxygen Co., at a meeting attended by 37 representatives of 22 Milwaukee companies engaged in the industry. I. A. McIntyre, Milwaukee Steel Foundry Co., is temporary president, and W. E. Van Dreser, local manager C. H. Hollup Corporation, temporary secretary. A permanent organization will be made at a second meeting on Dec. 18. D. W. Lunn of Chicago, who addressed the organization meeting, declared that Milwaukee might soon claim the distinction of being the welding center of America because of

the remarkable work accomplished by the A. O. Smith Corporation and other plants. Six plants in Milwaukee manufacture welding equipment, and a much larger number use it.

To Build Memorial Bridge Machinery

Contract for the operating trunnion and lock machinery for the Arlington Memorial Bridge has been awarded to Gears & Forgings, Inc., Cleveland, by the Phoenix Bridge Co., Phoenixville, Pa., the general contractors. This bridge, which will span the Potomac River at Washington, is a Strauss double-leaf bascule draw span. Each leaf is driven by two motors through inclosed herringbone reducing and equalizing double reduction gear units and the lock mechanism drive is through inclosed worm gear reductions. All gears, including the main operating rack, have cut teeth.

Operating machinery for two double-leaf bascule bridges of the Waddell Hardesty type, one of which will span the Northeast River and the other the Cape Fear River at Wilmington, N. C., is also being built by Gears & Forgings, Inc. This contract was awarded by the Vincennes Bridge Co., Vincennes, Ind.

New Trade Publications

Excavating Equipment.—Marion Steam Shovel Co., Marion, Ohio.—Four bulletins devoted to different types of excavators of 1½ and 2-yard capacity. Bulletin 334, 16 pages, illustrates and describes type 480 with electric rheostatic control. This is on a crawler tread and has a 2-yard bucket. Bulletin 335 of 16 pages illustrates the same type with Ward-Leonard control. Bulletin 336, 16 pages, illustrates the same type of excavator, but with steam operation rather than electric. Bulletin 337 illustrates and describes type 450 with gas-electric operation. The gas engine runs on constant speed, driving a d.c. generator and providing current for three motors.

Ingot Molds.—Gathmann Engineering Co., Baltimore.—Booklet of 30 pages, entitled "Big End Up vs. Big End Down." It illustrates and describes molds of various designs and shows sections of ingots cast in them. An argument is made for the use of molds with the big end up and recommendations are made as to best methods of handling molds in practice.

Ventilation for Air Painting Booths.—Paasche Airbrush Co., 1923 Diversey Parkway, Chicago.—Folder describing and illustrating an explosion-proof ventilating unit for an air-finishing booth. This is made in four sizes and for either a.c. or d.c. service.

Non-Corroding Pumps.—E. F. Doty Pump Co., 401 Ellicott Square, Buffalo.—Folder describing centrifugal pumps particularly adapted to handle corrosive and viscous fluids and solids. They can be equipped with

impellers of non-clogging type to handle solids in suspension and stringy or fibrous substances.

Texrope Drives.—Allis-Chalmers Mfg. Co., Milwaukee. Bulletin 1228-H of 16 pages illustrates and describes the use of belts of trapezoidal cross section for handling drives where the centers are close together. Most of those illustrated are multiple. The power is transmitted by the wedging contact between the belts and the V-shaped grooves.

Induction Motors.—Allis-Chalmers Mfg. Co., Milwaukee. Bulletin 1118-E of 16 pages illustrates and describes a line of polyphase induction motors of the sleeve and roller bearing types, built with steel frames. Many details of construction are shown.

Metal Edge Boxes.—National Metal Edge Box Co., Philadelphia. 28-page booklet of special shape showing the superiority of packages made with metal reinforcement strips at vertical corners, and containing a discussion of other factors which enter the problem of rugged packing boxes.

Furnace Insulation.—Celite Products Co., New York. Bulletin 103, containing 30 sectional drawings and 20 exterior views of electric and fuel-fired furnaces for diverse heat treating and baking operations.

Bearing Metal.—Invincible Bearing Metals Corporation, Sandusky, Ohio. Folder describing performance of "Eureka Metallon" bearings, made of leady bronze, so processed that the lead is uniformly dispersed in unusually fine particles.

Machinery Markets and News of the Works

Outlook Continues Promising

Some Let-up in Machine Tool Buying This Month but Increase Is Expected in the First Quarter

MACHINE tool buying has declined somewhat this month, as was to be expected, but the falling off is smaller than usual for the last month of the year. At Chicago sales have been on a par with those of the two previous months. The large amount of business in prospect assures a good first quarter business, barring untoward developments.

Aircraft companies are expected to become a more important factor in machine tool buying. The Curtiss Aeroplane & Motor Co., Buffalo, has bought 12 milling machines and other tools; the Glenn L. Martin Co., which has sold its Cleveland plant and will equip a new plant on the Eastern seaboard, has bought about \$35,000 worth of tools, and the Sperry Gyroscope Co., Brooklyn, has bought a number of tools. A great many aircraft and engine-building plants contemplate expansion during 1929. The Wright Aeronautical Corporation, Paterson, N. J., has announced that it will build Gypsy airplane motors for a light plane at some point in the Middle West.

New York

NEW YORK, Dec. 18.—Business in machine tools is still good, although the approach of the holidays has apparently caused some curtailment in the volume of new inquiry. Increases in prices of about 10 per cent have been made by some builders and others are reported considering similar price advances. No action on its list of tools has been taken by the New York, New Haven & Hartford Railroad, but the New York Central is still buying and closed on some tools the past week. The General Electric Co., Schenectady, continues an active buyer, closing on several pieces of equipment recently and has inquiries in the market for a number of tools, including three lathes, a screw machine and milling machine.

Railroad buying shows signs of improving. The Missouri Pacific and the Cotton Belt have each ordered several machines at St. Louis; the Southern has bought the tools on a recent list, and the Norfolk & Western still has some to order against an inquiry issued early in the fall. The New York, New Haven & Hartford has received bids on a list.

Export business is gaining, and the machine tool industry looks for substantial orders from abroad during the coming year. One Cincinnati company is reported to have orders on its books for \$250,000 worth of tools for France, as well as sizable orders from Germany and Italy.

The National Machine Tool Builders' Association reports that orders continued their upward trend during November, making the twelfth consecutive month of progressive increase. The association sees no signs of a recession for months to come, although a seasonal slackening may be looked for this month.

The Austin Mfg. Co., Harvey, Ill., has issued a sizable list.

No fresh buying by local aircraft manufacturers is reported, but the Curtiss Aeroplane & Motor Co., Buffalo, continues to buy against a list of machine tools estimated to be close to \$250,000, and is understood to have closed on a number of milling machines. The Sperry Gyroscope Co., Brooklyn, has bought a number of tools, including several lathes.

Recent sales by Niles Tool Works included a steam hammer, carwheel borer, carwheel lathe, journal turning and axle lathe, boring mill and three engine lathes. Machinery department of company reports sale of one radial drill, six grinders, six engine lathes, a bolt cutter, upright drill, milling machine, screw machine, gate shear and power hack saw. Pratt & Whitney Co. has booked orders recently for 11 sensitive and deep-hole drilling machines, 13 engine lathes, four vertical surface grinders, six jig boring machines, three profilers, three die sinkers, two bench lathes and a bench milling machine.

Pure Oil Co., 420 Lexington Avenue, New York, has taken bids on general contract for one-story unit, 120 x 175 ft., at Brooklyn, to cost about \$200,000 with equipment. William Higginson, 101 Park Avenue, New York, is architect and engineer.

National Lead Co., 111 Broadway, New York, has taken bids on general contract for one-story unit, 120 x 175 ft., at Brooklyn, to cost about \$200,000 with equipment. William Higginson, 101 Park Avenue, New York, is architect and engineer.

American Sugar Refining Co., 117 Wall Street, New York, is reported arranging addition to refinery at New Orleans, to cost more than \$150,000 with equipment.

Maxwell Schantz, 25 Spruce Street, New York, architect, has plans for two-story automobile service, repair and garage building on West Thirty-fifth Street, Brooklyn, to cost about \$100,000 with equipment.

Central Supply Co., 255 Pearl Street, New York, manufacturer of plumbing and heating equipment, is said to have plans for new plant at Radburn, a new industrial settlement near Paterson, N. J., to cost more than \$50,000 with equipment.

Schnell Penselpen Corporation, 130 West Forty-second Street, New York, manufacturer of a combination fountain pen and pencil, has purchased property at Arlington, N. J., for new plant, to cost more than \$70,000 with machinery.

Acme Metal Goods Mfg. Co., 2 Orange Street, Newark, manufacturer of metal products for domestic service, has purchased property, 60 x 100 ft., at Nassau Boulevard and 215th Street, Queens, L. I., for new factory.

John Polachek and other officials of Polachek Bronze & Iron Co. and Renaissance Bronze & Iron Co., affiliated organizations, both with plants at Long Island City, have organized Polachek Bronze & Iron Corporation and Renaissance Bronze & Iron Corporation, to take over and expand present companies. Erwin R. Geiger will be an official of both companies.

Electric Servidor Corporation, 147 West Twenty-ninth Street, New York, manufacturer of electric service specialties, has leased part of building at 357-9 Ogden Street, Newark, for branch plant to manufacture electric roasting machines.

Best Mfg. Co., 1200 Grove Street, Irvington, N. J., manufacturer of electrical and radio equipment, has awarded general contract to Kiegel & Spieler, Irvington, for two-story addition, 35 x 127 ft., to cost about \$40,000 with equipment. V. H. Strombach, 1234 Springfield Avenue, is architect.

Morrison Machine Co., 204 Van Houten Street, Paterson, N. J., manufacturer of textile machinery and parts, has acquired about 2½ acres, with one-story building of about 100,000 sq. ft. of floor space, from American Locomotive Co., for new factory for increase in output.

Kullman Dining Car Builders, Inc., 61 Empire Street, Newark, Samuel Kullman, president, has acquired two-story factory at Frelinghuysen Avenue and Queen

Street, 50 x 300 ft., for expansion. It is understood present works will be removed to new location.

F. H. Koenigsberger, 48 Walnut Street, Newark, architect, will soon take bids on general contract for three-story automobile service, repair and garage building at Kearny, to cost about \$100,000 with equipment.

Rhodia Chemical Co., Jersey Avenue, New Brunswick, N. J., manufacturer of patented wire glass, etc., is planning construction of two one-story additions, to cost more than \$35,000 with equipment.

Paramount Welded Aluminum Products Corporation, Brooklyn, manufacturer of airplane fuel and oil tanks, engine cowlings, pilot seats and other aircraft products, has removed from 429 Kent Avenue to 195 Morgan Avenue. Company has recently purchased shop materials, machines, tool stands and other equipment. J. Billig is president.

New England

BOSTON, Dec. 17.—The past week was quiet with the majority of machine tool dealers. Several thousand dollars worth of heavy production tools were sold by a Boston dealer to Vermont manufacturers, and a used tool dealer shipped a 16-in. x 8-ft. lathe, a large number of hand millers and miscellaneous bench equipment. New England machine tool builders are busy, some maintaining night shifts. A shortage of skilled workers still exists.

Small tools are selling freely, December sales greatly exceeding those for the same period last year.

Cone Automatic Machine Co., Windsor, Vt., has started work on an addition.

Walter Atherton and Carroll Tiffany, architects, 148 State Street, Boston, have closed bids for a two-story trade high school at Medford, Mass., to cost \$125,000 without equipment. P. S. Ferguson is chairman of building committee.

Frank B. Perry, 44 Franklin Street, Providence, architect, closed bids Dec. 15 for a two-story and basement, 60 x 400 ft. jewelry manufacturing plant for Cohn & Rosenberger, Inc., Providence.

Ernest J. Batty, 13 Temple Street, Quincy, Mass., closed bids Dec. 15, on a one-story and basement school addition, 32 x 64 ft., at Braintree, Mass., to contain a manual training department.

Reed-Prentice Corporation, Worcester, Mass., has recently added to its machine shop equipment four Warner & Swasey and two Gisholt turret lathes, one Bickford and one Carlton 5-ft. radial drills, and a number of other machine tools. Considerable new foundry equipment has also been purchased.

Bird & Son, Inc., Washington Street, East Walpole, Mass., manufacturer of roofing, has asked bids on general contract for one-story addition, including improvements in present unit, to cost about \$45,000 with equipment.

Indian Motorcycle Co., Springfield, Mass., is said to be arranging to use part of plant for production of new type of aircraft motors, including parts and assembling.

Rhode Island Malleable Iron Works, Hillsgrove, R. I., has purchased plant and business of Rhode Island Fittings Co., Providence, and will consolidate with organization. Merged company will have a capital of \$1,000,000 and plans expansion.

The Crane Market

IN the past week to 10 days there has been an increase in the number of inquiries for overhead cranes, especially electric and hand power equipment of small capacity. One of these inquiries asks for prices on eight small hand power and electric cranes and another recent request for prices is from the American Enka Corporation, 114 East Thirty-second Street, New York, in the market for a 10-ton hand power and a 20-ton electric traveling crane for a plant at Asheville, N. C. Business in locomotive cranes continues limited.

In the New England district, Stone & Webster, Inc., Boston, is inquiring for a 100-ton electric overhead crane for the Puget Sound Electric Railway.

Among recent sales are:

Sutton & Suderly Brick Co., Coeymans, N. Y., 2-ton, 30-ft. span, 3-motor overhead crane from Shepard Electric Crane & Hoist Co.

New England Gas & Electric Association, Worcester, Mass., is disposing of bond issue of \$6,000,000, part of proceeds to be used for extensions and improvements, including transmission lines.

Central Maine Power Co., Augusta, Me., is completing plans for construction of hydroelectric generating plant on Kennebec River, near Bingham, Me., with initial output of 60,000 hp., to cost more than \$500,000 with transmission system.

Bridgeport Brass Co., Bridgeport, Conn., is said to be planning new one-story unit, to cost over \$75,000 with equipment.

Acme Metal Treating Co., Inc., 108 Beachview Avenue, Bridgeport, Conn., has been organized to engage in metal treating, including pack, die, high-speed steel cyanide hardening and annealing. Company's charter also calls for machine shop which will be installed at some future time.

Pittsburgh

PITTSBURGH, Dec. 17.—The prospect for the early part of next year is exceptionally bright. Steel manufacturers have taken up projects that they have had in blueprints for a year or more and builders of rolling mills are counting on some heavy releases after the turn of the year. These programs will mean purchases of machine tools and of cranes. At least 11 cranes will be wanted for the Youngstown Sheet & Tube Co. Indiana Harbor improvements, while another large lot will be wanted in the new construction of the A. M. Byers Co.

Liberty Dairy & Products Co., New Kensington, Pa., plans rebuilding part of machine shop and ice plant, destroyed by fire Dec. 7.

Spang, Chalfant & Co., Inc., Union Bank Building, Pittsburgh, manufacturer of pipe, tubing, etc., has asked bids on general contract for one-story addition to plant at Etna, 240 x 800 ft., to cost more than \$400,000 with equipment.

Libbey-Owens Sheet Glass Co., Charleston, W. Va., has asked bids on general contract for additions in cutting division at branch plant at Kanawha, W. Va., to cost more than \$80,000 with equipment.

W. A. Harriman & Co., 39 Broadway, New York, bankers, have acquired S. R. Dresser Mfg. Co., Bradford, Pa., manufacturer of pipe couplings, sleeves, fittings, etc. New company has been organized under same name and stock issue of \$4,800,000 is being sold, part of fund to be used for expansion. Fred A. Miller is president.

United States Chromium Corporation, Wilksburg, Pa., has plans for one-story plant unit, 75 x 100 ft., to cost over \$50,000 with equipment.

Philadelphia

PHILADELPHIA, Dec. 17.—Contract has been let by Thomas S. Gassner Co., 4545 Wayne Avenue, Philadelphia, manufacturer of metal sash, etc., to John N. Gill Construction Co., 121 North Broad Street, for two-story addition, to cost about \$45,000 with equipment.

Board of Education, Keystone Building, Philadelphia, is asking bids until Jan. 3 for steel lockers, hardware, equipment, supplies, etc. Edward Merchant is secretary and business manager.

Schneider-Bowman Co., Van Dyke Street, Philadelphia, plans rebuilding part of foundry and pattern shop destroyed by fire Dec. 11 with loss over \$70,000 with equipment.

General Refractories Co., 106 South Sixteenth Street, Philadelphia, is arranging for increase in capital from 225,000 to 300,000 shares of stock, no par value, for expansion.

M. A. Regan, 5903 Cobbs Creek Parkway, Philadelphia, and associates have organized Philadelphia Metal Works, and plan early operation of local plant to manufacture machine equipment and metal products. Rudolph Weber, 4445 North Third Street, is also interested in company.

Frederick H. Levey Co., 222 Forty-fourth Street, Brooklyn, manufacturer of inks, etc., has acquired six-story factory, 95 x 216 ft., at Washington Avenue and Thirteenth Street, Philadelphia, heretofore held by General Electric Co., and will remodel for new plant.

Crescent Insulated Wire & Cable Co., Olden and Taylor Avenues, Trenton, N. J., has awarded general contract to Karno-Smith Construction Co., Broad Street Bank Building, for two-story addition, 110 x 115 ft., to cost about \$85,000 with equipment. J. Osborne Hunt, Hunt Building, is architect.

Central Airport, Inc., Philadelphia, care of Black & Bigelow, Inc., 551 Fifth Avenue, New York, consulting engineer, has plans for airport at Camden, N. J., consisting of hangars, repair and reconditioning shops, oil storage and other buildings, to cost about \$1,750,000.

Phoenix Horse Shoe Co., Joliet, Ill., is concluding negotiations for purchase of plant and business of Bryden-Neverslip Co., Catasauqua, Pa., manufacturer of horse shoes, pliers, etc., with branch plants at New Brunswick, N. J., and Montreal, effective Jan. 1. Purchasing company plans expansion in eastern district.

Standard Tractor Co., Harrisburg, Pa., care of Harrisburg Commercial and Industrial League, Charles K. Stevenson, president, now being organized by local interests, headed by O. E. Williams, is arranging for purchase of property for new plant to manufacture farm tractors and kindred agricultural equipment, including parts and assembling department.

ments, initial units to cost more than \$85,000 with machinery.

American Steel & Wire Co., South High Street, Allentown, Pa., has awarded general contract to American Bridge Co., 30 Church Street, New York, for one-story addition to local plant, to cost over \$50,000 with equipment. Headquarters are at 208 South LaSalle Street, Chicago.

City Council, Coatesville, Pa., is planning municipal airport, including hangar, repair shop and other units, to cost more than \$65,000. Frank Breuninger, member of council, is chairman of committee in charge.

Cincinnati

CINCINNATI, Dec. 17.—While machine tool buying has shown a further recession the past week and few purchases of importance are expected until after the first of the year, business this month is considered good compared with December in recent years. It is likely, however, that bookings will be substantially less than the monthly average for the previous six months. Machine tool manufacturers are confident that the first quarter of 1929 will be an active period. Prospects in the automobile industry are promising for the purchase of considerable equipment, and business from the general industrial field probably will remain at or near its present high level. Most executives are of the opinion that buying by railroads next year will not much exceed the rather meager volume of the past 12 months.

That foreign trade may be expanded somewhat in 1929 is the belief of some local machine tool companies. A few manufacturers, building single-purpose tools for the automobile and other highly specialized industries have secured a liberal amount of business from European countries this year. One company is reported to have bookings totaling more than \$250,000 from France alone, as well as good-sized orders from England, Germany and Italy. In the past week a Cincinnati builder secured a substantial percentage of its business from European countries.

Southern Railway has bought the tools on its recent list, but Norfolk & Western still has a few items to purchase. Local plants continue to operate on heavy production schedules, although this activity is not equally distributed among the various machine tool companies.

Bids will soon be asked by Jaeger Machine Co., 518-20 Dublin Road, Columbus, Ohio, for one and two-story addition, to cost about \$50,000 with equipment. Bassett & Tresselt, 217 East Broad Street, are architects.

Leland Electric Co., 222 North St. Clair Street, Dayton, Ohio, manufacturer of fractional horsepower motors, parts, etc., has awarded general contract to C. H. Shook, Inc., Dayton, for one-story addition, 165 x 485 ft., and boiler plant, to cost about \$225,000 with equipment. Baling Co., Twelfth and Chestnut Streets, Philadelphia, is architect and engineer.

Avey Drilling Machine Co., 25 East Third Street, Cincinnati, has awarded general contract to B. T. Wisenall, Covington, Ky., for one-story addition to Covington plant, to cost about \$28,000 with equipment.

Samuel Stamping & Enameling Co., Chattanooga, Tenn., is planning expansion program at North Chattanooga, to cost about \$100,000 with equipment. It is

proposed to more than double present capacity.

Murray Corporation of America, Inc., Detroit, has purchased tract of 45 acres at Memphis, Tenn., for new plant to manufacture automobile bodies, consisting of main one-story unit, 575 x 640 ft., and auxiliary buildings, to cost over \$1,500,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Hardwick Stove Co., Cleveland, Tenn., has approved plans for construction of four-story unit, to cost about \$100,000 with equipment.

Gem Metal Shield Co., 199 Bacon Street, Dayton, Ohio, plans new one-story factory totaling about 25,000 sq. ft. floor space, to cost over \$60,000 with equipment.

Plant and business of W. J. Savage Co., 912 West Clinch Avenue, Knoxville, Tenn., manufacturer of equipment for coal mines, quarries, etc., have been acquired by new interests, headed by W. M. Fulton, 820 Temple Avenue. New owners plan expansion, including other branches of machinery manufacture.

LeBlond Aircraft Engine Corporation, Cincinnati, has announced that LeBlond engine has passed United States Navy 50-hour endurance test and company has been granted United States Department of Commerce type certificate No. 12. Production soon will be increased to four engines a day.

Cleveland

CLEVELAND, Dec. 17.—Machine tool sales held up well through the first half of December, which is usually a quiet month in the machinery trade. Considerable slowing down is expected during the remainder of the month. There was a fair volume of scattered business the past week, which was well distributed, a moderate portion coming from industries outside of the automotive field. A local manufacturer of turret lathes, whose sales were exceptionally good in November, reports that its business so far this month has exceeded the previous month.

Glenn L. Martin Co., Cleveland, during the week purchased six machines aggregating about \$35,000 for partly equipping a new plant. Company will erect a plant in the East to manufacture airplanes for Navy Department, but pending selection of a permanent site it will equip a plant for experimental work at Baltimore, Curtiss Aeroplane & Motor Co., Buffalo, has placed an order with Kearney & Trecker Co. for 12 new type Milwaukee millers, several other milling machines and special fixtures aggregating \$82,000.

Kelley Reamer Co., 3705 West Seventy-third Street, Cleveland, has awarded general contract to Julius Linder, 15615 West Delaware Avenue, Lakewood, for one-story addition to cost \$35,000 with equipment. Edward W. Putnam is president.

Gluntz Brass Foundry Co., 3301-5 East Fifty-fifth Street, Cleveland, has plans for one-story plant to cost \$70,000 with equipment.

American Steel & Wire Co., Rockefeller Building, Cleveland, has plans for new one-story rod mill at Cuyahoga Works, to cost more than \$150,000 with equipment.

Jordan Motor Co., 1070 East 152nd Street, Cleveland, has awarded general contract to Hunkin-Conkey Construction Co., Hunkin-Conkey Building, for one-

story addition, 45 x 100 ft., to cost about \$45,000 with equipment.

Dart Boats, Inc., 2215 Collingwood Avenue, Toledo, Ohio, W. C. Hayes, president, has awarded general contract to Comte-Nauman Co., 912 Summit Street, for one-story boat-building and repair plant, 65 x 300 ft., to cost about \$75,000 with equipment.

McKinley Aeroways, Inc., Canton, Ohio, recently organized, has acquired McKinley airport on Louisville Road and plans development of air terminal, including construction of hangars, repair and reconditioning shops, and other mechanical units, to cost more than \$60,000.

Sandusky Cement Co., Sandusky, Ohio, has authorized change of name to Medusa Portland Cement Co., and will increase capital from 75,000 to 225,000 shares of stock, no par value, part of proceeds to be used for expansion. Mills are operated at Bay Ridge, near Sandusky; Silica, Ohio; York, Pa., and Dixon, Ill.

Youngstown Sheet & Tube Co., Stambaugh Building, Youngstown, Ohio, is having plans completed by Allen & Garcia Co., 332 South Michigan Avenue, Chicago, consulting engineer, for new coal mining and washing plant in western Pennsylvania, to cost over \$850,000 including machinery.

Detroit

DETROIT, Dec. 17.—Contract has been let by Ajax Bolt & Nut Co., 5623 Gratiot Avenue, Detroit, to Alois LaPeirre, Grosse Pointe Park, Mich., for rebuilding part of two-story plant recently destroyed by fire, to cost close to \$50,000 with equipment.

Michigan Smelting & Refining Co., 7885 Joseph Campau Avenue, Detroit, has awarded general contract to Kreighoff Construction Co., Detroit, for an addition to cost over \$70,000 with equipment. Christian W. Brandt, Kresge Building, is architect.

Zenith-Detroit Corporation, Hart Avenue, Detroit, manufacturer of carbureters, etc., has awarded general contract to F. N. Cooper, 6370 Gratiot Avenue, for two-story and basement addition, 62 x 120 ft., to cost about \$60,000 with equipment.

Grasselli Chemical Co., 629 Euclid Avenue, Cleveland, subsidiary of E. I. duPont de Nemours & Co., Wilmington, Del., has acquired 20 acres at Ecorse, Mich., for new plant to manufacture sulphuric acid, initial unit to cost about \$1,000,000 with machinery, and ultimate plant about five times that sum.

Timken-Detroit Axle Co., Clark Street, Detroit, has awarded general contract to C. O. Barton Co., 1900 East Jefferson Avenue, for two-story addition, to cost about \$55,000 with equipment.

Wilcox-Rich Corporation, Detroit, manufacturer of valves, piston rings, etc., for automobile engines, is completing arrangements for purchase of plant and business of Rich Tool Co., 1501 East Ferry Street, manufacturer of kindred equipment, and will merge with its organization. Consolidated company will operate plants at Marshall, Saginaw and Battle Creek, Mich., and plans expansion.

Board of Education, Coloma, Mich., contemplates installation of manual training equipment in new two-story grade and high school to cost about \$130,000, for which bids will soon be asked on general contract. Warren, Holmes & Powers Co., 820 Michigan Avenue, Chicago, are architects.

Star Tool & Die Works, 2520 Twenty-fourth Street, Detroit, is arranging gen-

eral expansion program, including installation of machine tools and other equipment.

National Moulding Co., 675 Richmond Avenue, Northwest, Grand Rapids, Mich., has been organized to manufacture special steel and brass shapes, such as automobile garnish moldings, window channels, etc. Equipment has been purchased and plant is expected to be in operation this month.

Columbia Tool Steel Co., has moved its Detroit office from 144 East Woodbridge Street to 1718 Howard Street.

Chicago

CHICAGO, Dec. 17.—Sales in the first half of December equalled the average of the two preceding months, a situation unparalleled in previous years with the possible exception of the war period. Fresh inquiry remains at a high level, but indications are that in the next two weeks considerable business will be held for placement after Jan. 1.

The Missouri Pacific and the Cotton Belt each have ordered several machine tools at St. Louis. At Chicago a demand for presses is noted, and at Harvey, Ill., the Buda Co. is closing its list. Purchases against the Fort Wayne list of the International Harvester Co. have been delayed, but orders will probably be placed soon after the first of the year. The Nash Motors Co., Racine, Wis., and the Marmon Motor Car Co., Indianapolis, are said to be planning extensions.

Illinois Power & Light Co., 231 South LaSalle Street, Chicago, is planning construction of a gas plant at Decatur, Ill., to cost \$300,000. T. J. Lucas is engineer.

General Engineering Works, 340 West Huron Street, Chicago, manufacturer of screw machine products, has plans for one-story plant to cost about \$55,000 with equipment. Weiss & Niestedt, 53 West Jackson Boulevard, are architects.

Baker Stove Co., 818 Church Street, Belleville, Ill., is having plans drawn for new three-story plant, 115 x 120 ft., to cost about \$60,000 with equipment. Gill & Jackson, 1328 Walnut Street, Murphysboro, Ill., are architects.

Studebaker Sales Co., 45 West Twenty-fourth Street, Chicago, has asked bids on general contract for new multi-story service, repair and sales building, to cost \$350,000 with equipment. Loewenberg & Loewenberg, 150 West Monroe Street, are architects.

Andrews Wire & Iron Works, 1802 Preston Avenue, Rockford, Ill., has work under way on one-story addition, 100 x 125 ft., to cost over \$50,000 with equipment.

Great Northern Railway Co., St. Paul, Minn., will soon begin construction of addition to engine house and repair shops at Whitefish, Mont., to cost \$70,000 with equipment. J. R. W. Davis, St. Paul, is chief engineer.

Independent Pneumatic Tool Co., 600 West Jackson Boulevard, Chicago, has plans for an addition to plant at Aurora, Ill., to cost over \$40,000 with equipment.

Board of Education, Blue Island, Ill., is said to be planning installation of manual training equipment in new two-story addition to high school to cost \$350,000, for which plans have been drawn by Perkins, Chatten & Hammond, 160 North LaSalle Street, Chicago, architects.

Des Moines Steel Tank Co., Des Moines, Iowa, will soon erect two buildings to manufacture steel tanks, small

buildings, baskets and other livestock equipment. Company recently acquired factory at East Des Moines for tank production. New units, which will cost \$60,000, will double present capacity. John M. Albrecht is owner.

Herman Nelson Corporation, Eighteenth Street and Third Avenue, Moline, Ill., manufacturer of heating and ventilating devices and equipment, will soon begin work on two-story addition to factory and extension to office building to cost about \$60,000.

Dreis & Krump Mfg. Co., 7416 Loomis Boulevard, Chicago, maker of sheet metal machinery, has purchased Kutscheid Mfg. Co., Chicago, maker of power shears, and will extend manufacturing of latter company.

Milwaukee

MILWAUKEE, Dec. 17.—The first half of the month produced a substantial volume of new business for machine-tool builders in this locality, although sales were hardly as numerous as in previous weeks. Inquiry, however, gives promise of a good demand after the turn of the year, the present slackening being more or less seasonal, but less pronounced than in former years. Machine tool executives regard the future as bright, and look for a new year probably as active as 1928.

Plans for expenditure of approximately \$1,000,000 for erection and equipment of a new steel stamping unit have been made public by Charles W. Nash, president Nash Motors Co., Kenosha, Wis. This is in addition to a \$3,000,000 enlargement program now under way at Kenosha, Racine, Milwaukee and Pine Bluff, Ark., factories. Location of the steel products plant is contingent upon the closing of Phillips Avenue, Racine, by action of Common Council. David M. Averill is general manager Racine division.

General Refrigeration Co., 108 East Shirland Avenue, Beloit, Wis., manufacturer of railroad and commercial refrigerating systems, contemplates extension early in 1929, for which plans are now being prepared. T. E. Swords, Rockford, Ill., is president, and J. J. Tyndal, Beloit, secretary.

Modine Mfg. Co., Racine, Wis., manufacturer of radiators and cooling systems for internal combustion engines, automotive, industrial, etc., expects to start work after Jan. 1 on an extension to its plant to cost \$100,000.

Fish Rotary Oven Co., Walworth, Wis., manufacturer of bakery equipment and machinery, will move its plant and headquarters to Beloit, Wis. A site at Henry Avenue and Chicago, Milwaukee, St. Paul & Pacific Railway in Beloit has been purchased, and construction will start about March 1.

F. M. Harbach, secretary and business manager Milwaukee Board of School Directors, 1002 McKinley Avenue, Milwaukee, closes bids Jan. 3 on a \$400,000 addition to Boys' Trade and Technical High School, at Virginia, Greenbush and Hanover Streets. G. E. Wiley is school board architect.

Rockton Electric Co., Rockton, Ill., subsidiary of Wisconsin Power & Light Co., 16 North Carroll Street, Madison, Wis., will place contracts late this month for a \$150,000 hydroelectric generating unit, 32 x 65 ft., designed by Mead & Seastone, consulting engineers, Madison. Equip-

ment orders will be placed shortly. E. J. Kallevang is chief engineer.

Western Metal Specialty Co., Milwaukee, manufacturer of sheet metal parts for automotive and industrial trade, has placed contracts for addition and new office. This is third addition made within year, which will increase manufacturing facilities 25 per cent.

South Atlantic

BALTIMORE, Dec. 17.—Contract has been let by Chemical & Pigments Co., St. Helena, Baltimore, to Price Construction Co., Maryland Trust Building, for new units, including storage and distributing building and power plant, to cost about \$85,000 with equipment.

Qvens, power equipment, conveying and other machinery will be installed in three-story plant to be constructed at Washington by General Baking Co., 420 Lexington Avenue, New York, for which bids will be received on general contract until Dec. 27. C. B. Comstock, 110 West Fortieth Street, New York, is architect and engineer.

City Council, Charleston, S. C., is planning municipal airport, to include hangars, repair and reconditioning shops and other units, to cost over \$50,000. Tract of 800 acres at Ten Mile Station has been secured. Caspar S. Chisholm, 50 Broad Street, is chairman of committee in charge.

Virginia Barrel Co., Winchester, Va., has acquired property at Mariners Harbor, Staten Island, N. Y., formerly held by Downey Shipbuilding Corporation, and plans construction of new plant for Eastern trade, to cost more than \$65,000 with equipment.

Georgia Power & Light Co., Valdosta, Ga., is planning extensions in power plant to cost about \$80,000 with equipment. One-story unit will be built, 100 x 200 ft., and present station removed to building, with installation of additional machinery.

Albemarle-Chesapeake Corporation, Inc., West Point, Va., has awarded general contract to John T. Wilson Co., Inc., Richmond, Va., for new mill to manufacture kraft papers, to cost more than \$1,000,000 with machinery. Ellis Olsson, vice-president, is engineer in charge.

Public Improvement Commission, Municipal Office Building, Baltimore, will soon take bids on general contract for two-story polytechnic institute, to cost about \$1,000,000 with equipment, including manual training facilities. C. H. Anderson, 9 East Pleasant Street, is architect. Henry Adams, Calvert Building, is consulting engineer.

Asiatic Petroleum Co., Ltd., 65 Broadway, New York, will begin work on new storage and distributing plant at Wagners Point, Baltimore, with facilities for handling about 130,000 gal., to include boiler house, machine shop and other units, to cost more than \$150,000 with equipment.

Provision Co., Columbus, Ga., T. G. Strange, head, has plans for new meat-packing plant, with mechanical handling facilities, including conveying equipment. Refrigerating plant will be installed. Project will cost more than \$75,000 with equipment. Henschien & McLaren, 1637 Prairie Avenue, Chicago, are architects.

Locke Insulator Corporation, Charles and Cromwell Streets, Baltimore, manufacturer of high-tension electrical insulators, has engaged W. S. Austin, Maryland Trust Building, architect and

engineer, to prepare plans for additional units, including testing building, and storage and distributing extension, to cost \$55,000.

Gulf States

BIRMINGHAM, Dec. 17.—Goodyear Tire & Rubber Co., Akron, Ohio, has acquired tract of 275 acres at Gadsden, Ala., for new mill. Initial unit will comprise several buildings, and is estimated to cost more than \$1,500,000 with machinery. Four such units are projected, with entire cost of \$6,000,000. Company is also considering new fabric mill at same location.

Richard T. Wilson, 218 Sixth Avenue, North, Nashville, Tenn., and associates have acquired property at Birmingham for new plant to manufacture railroad equipment, including rail joints, etc., initial unit to cost about \$100,000 with machinery.

Houston Natural Gas Co., Houston, Tex., is disposing of bond issue of \$2,000,000, not less than \$500,000 to be used for extensions and improvements in properties, including pipe line construction.

Rushton Corporation, 2124 South Fourth Avenue, Birmingham, has approved plans for one-story ice-manufacturing plant in Mount Brook Village district, to cost about \$50,000 with equipment.

Tampa Shipbuilding & Engineering Co., Tampa, Fla., has plans for floating dry-dock to handle large vessels, including shops and equipment for construction and repair work. Project is reported to cost more than \$1,000,000.

Texarkana & Fort Smith Railway Co., Texarkana, Tex., with headquarters at Kansas City, Mo., is planning new engine terminal and repair shops at Dowling, Tex., including engine house, machine shops, compressor building, power house and other structures, to cost more than \$150,000 with equipment.

El Paso Natural Gas Co., El Paso, Tex., care of White, Weld & Co., 14 Wall Street, New York, recently formed, is planning construction of 16-in. pipe line from Lea County, N. M., oilfields to El Paso and vicinity, about 200 miles for natural gas supply, to cost about \$3,000,000. Company is arranging for sale of bond issue of \$3,500,000.

City Council, Montgomery, Ala., has acquired 800 acres for municipal airport, to include hangars, repair and reconditioning shops, oil storage and other buildings. An aeronautical school on portion of site is under consideration. Project is reported to cost more than \$90,000.

Pullman Car & Mfg. Corporation, 79 East Adams Street, Chicago, has purchased car building works of Tennessee Coal, Iron & Railroad Co., Birmingham, and plans enlargement.

Planters' Cotton Oil Co., El Paso, Tex., care of George E. Moore, 3419 Madison Avenue, recently formed by Mr. Moore and associates, with capital of \$300,000, is said to be planning early operation of local mill.

Dubus & Atwood Co., Crowley, La., has been organized to take over and operate local plant of Acadia Iron Works. Plans are under way for expansion. Wilton Dubus and Frank Atwood head new company.

A. C. Burton & Co., 1402 Main Street, Houston, Tex., local representatives for Chrysler automobile, have purchased property at Milan and Bell Streets and

plan four-story service, repair and garage building, to cost about \$225,000 with equipment. Joseph Finger, Keystone Building, is architect.

J. E. Morgan, San Juan, Tex., and associates plan construction of new cold storage and refrigerating plant at Donna, Tex., to cost over \$70,000 with equipment.

Buffalo

BUFFALO, Dec. 17.—Exolon Co., Commercial Avenue, Blasdell, N. Y., manufacturer of abrasives, has acquired adjoining tract of nine acres and plans addition, to cost more than \$75,000 with equipment, work to begin early next year.

National Carbon Co., 3625 Highland Avenue, Niagara Falls, N. Y., manufacturer of storage batteries, etc., has awarded general contract to Wright & Kremers, Inc., Main Avenue and Pine Street, for one-story addition, to cost about \$50,000 with equipment.

Curtiss Aeroplane & Motor Co., 74 Kail Street, Buffalo, has acquired properties and assets of Reid Aircraft Co., Ltd., Montreal, and will operate in future as a Canadian subsidiary, with name of Curtiss-Reid Aircraft Co., Ltd., capitalized at 350,000 shares of stock, no par value. It is also planned to increase output of Montreal factory and use for distributing center for Curtiss airplanes. J. A. B. Smith is treasurer of new company.

Binghamton Light, Heat & Power Co., Binghamton, N. Y., has arranged for bond issue of \$1,000,000, part of proceeds to be used for expansion, including transmission lines. Company is operated by General Gas & Electric Co., 50 Pine Street, New York.

G. L. F. Exchange, Phelps, N. Y., H. E. Babcock, general manager, operating local fertilizer manufacturing plant, has acquired former plant of Universal Gypsum & Lime Co., at Batavia, N. Y., and will remodel for mechanical-mixer plant. Portion of structure will be given over for storage and distribution, with mechanical handling equipment.

William Schall & Co., 160 Broadway, New York, bankers, have purchased plant and business of Brown-Lipe Gear Co., Syracuse, N. Y., manufacturer of automobile gears and transmissions, for about \$3,400,000. Company will be reorganized and expanded.

Department of Public Works, Municipal Building, Buffalo, George F. Fisk, commissioner, will receive bids until Jan. 3 for metal furniture and equipment for new city court building, as per specifications on file.

St. Louis

ST. LOUIS, Dec. 17.—General Aero Co., Wichita, Kan., has been organized to take over and operate Swallow Airplane Co. and Cessna Aircraft Co., both with local plants. Expansion is being arranged. General company will also acquire a company which manufactures airplane propellers, and an aircraft motor manufacturing company, names to be announced later.

St. Louis Public Service Co., 3869 Park Avenue, St. Louis, has filed plans for two-story addition to equipment and mechanical shop at 577 DeBaliviere Avenue, 27 x 100 ft., to cost about \$40,000 with tools, etc.

Wagner Electric Corporation, 6400 Plymouth Street, St. Louis, manufacturer of motors, will soon take bids on general

contract for five-story unit, 80 x 120 ft., and one-story extension, 120 x 375 ft., to cost over \$500,000 with equipment. Three crane runways will be installed for 30, 5 and 2-ton capacity traveling cranes. Condon & Post, 53 West Jackson Boulevard, Chicago, are architects.

Little Rock Refining Co., 505 A. O. U. W. Building, Little Rock, Ark., has plans for new oil refinery near city, with capacity of about 1000 bbl. crude oil per day. Initial unit will cost about \$100,000. William Bruick is company construction engineer, address noted.

Charles M. Dunning Construction Co., 420 North Hudson Street, Oklahoma City, Okla., has secured award for eight-story and basement automobile service, repair and garage building, 76 x 150 ft., for local interests, to cost \$265,000 with equipment.

Knoll Aircraft Corporation, 471 West First Street, Wichita, Kan., T. N. Thomas, president, is said to be planning new airplane manufacturing plant near municipal airport, to cost about \$85,000 with equipment.

Titanium Pigment Co., 1 Sidney Street, St. Louis, has awarded general contract to Fruin-Colnon Construction Co., Merchants Laclede Building, for power plant at factory, to cost \$40,000 with equipment.

City Council, Muskogee, Okla., is arranging for extensions and improvements at municipal airport, known as Hatbox Flying Field, for which bonds in amount of \$195,000 have been approved, including hangars, repair shop and other buildings.

J. I. Case Threshing Machine Co., Racine, Wis., has awarded general contract to John Mehuron, 1045 South Twenty-sixth Street, Lincoln, Neb., for one-story factory branch and distributing plant at Lincoln, 75 x 90 ft., to cost about \$25,000 with equipment.

Camden Furniture Co., Camden, Ark., is arranging an expansion program, to cost over \$85,000 with equipment.

Indiana

INDIANAPOLIS, Dec. 17.—Board of Education, Gary, plans installation of manual training equipment in new high school to cost about \$900,000. William B. Ittner, 911 Locust Street, St. Louis, is architect.

Globe-Bosse-World Furniture Co., Evansville, is planning to rebuild part of plant destroyed by fire Dec. 11, with loss reported over \$250,000 including machinery.

Ross Caldwell, 239 Cumberland Street, Anderson, architect, is completing plans for two-story automobile service, repair and garage building, to cost about \$100,000 with equipment.

S. F. Bowser & Co., Fort Wayne, manufacturers of gasoline pumps, etc., are carrying out an expansion program, including establishment of new chromium plating department to cost \$50,000, for development of new line of production.

Board of Trustees, Purdue University, West Lafayette, is having plans drawn for new engineering building, to cost about \$150,000 with equipment. Walter Scholer, Painters' and Decorators' Building, Lafayette, is architect.

John Deere Plow Co., 216 South Senate Avenue, Indianapolis, has awarded general contract to Indiana Engineering & Construction Co., Central Building, Fort Wayne, for four-story storage and distributing plant, 100 x 100 ft., at Fort

Wayne, to cost about \$125,000 with equipment. Headquarters are at Moline, Ill.; O. A. Eckerman is company architect at last-noted address.

Municipal Electric Light & Power Works, Fort Wayne, is having plans prepared for a power house to cost \$300,000. Froelich & Emery, Toledo, Ohio, are engineers.

Goble Gas Regulator Co., Anderson, is building an addition, 40 x 100 ft.

Pacific Coast

SAN FRANCISCO, Dec. 12.—Los Angeles Can Co., Los Angeles, subsidiary of Continental Can Co., 1 Pershing Square, New York, has awarded general contract to Scofield-Twaits Co., Pacific Finance Building, for one and two-story plant, main unit, 300 x 500 ft., to cost about \$1,000,000 with machinery. Francisco & Jacobus, Pershing Square Building, New York, are architects and engineers.

Anaheim Co-Operative Orange Growers' Association, Anaheim, Cal., is planning new three-story pre-cooling plant and packing house addition, to cost about \$85,000 with equipment.

Southern Sierras Power Co., Riverside, Cal., is having plans drawn for new equipment storage, distributing and repair plant, consisting of six one-story units, with main shop, 100 x 140 ft., including outside crane runway, 40 x 140 ft., to cost over \$100,000 with equipment. C. A. Kelly is purchasing agent, in charge.

California Art Tile Co., Main and Twenty-seventh Streets, Richmond, Cal., is planning an expansion and improvement program, to cost about \$400,000 with equipment.

Ballard Drop Forge Co., 1145 West Forty-sixth Street, Seattle, has begun construction of one-story unit, 56 x 120 ft., to replace building recently destroyed by fire.

Inland Power & Light Co., Portland, Ore., is planning hydroelectric power development on Lewis River, in Clarke, Cowlitz and Skamania Counties, Wash., with total capacity of 233,000 hp., to cost more than \$5,000,000 with transmission system.

Pacific Coast Borax Co., Wilmington, Los Angeles, has asked bids on general contract for one-story storage and distributing plant, 50 x 800 ft., to cost about \$100,000 with equipment. A. C. Martin, Higgins Building, is architect.

Union Ice Co., San Francisco, has plans for new plant at Torrance, Cal., to cost over \$75,000 with equipment.

Northwestern Pacific Railroad Co., 64 Pine Street, San Francisco, has approved plans for one-story equipment repair shop at Tiburon, Cal., to cost about \$35,000 with machinery. Engineering department, address noted, is in charge.

Northwestern Electric Co., Portland, is planning enlargements in steam-operated electric power plant, to cost over \$1,000,000 including extensions in transmission lines.

General Petroleum Corporation, Higgins Building, Los Angeles, has authorized construction of pipe line from properties in Kettleman Hills field to Lost Hills and vicinity, about 35 miles, to cost about \$300,000. W. B. Pyles is company superintendent, in charge.

Empire Development Co., care of H. L. Haehl, Humboldt Bank Building, San

Francisco, is planning hydroelectric power development on Kern River, Tulare County, to cost more than \$20,000,000 with transmission system.

Canada

TORONTO, Dec. 17.—While builders and dealers report a large prospective demand for machine tools, sales the past week were below the average of former weeks. The curtailed buying, however, is due to the approaching holiday season. A number of buyers are considering lists for replacement and new works, but most of this business will be carried over into the new year. The chairman of the committee on public utilities, Winnipeg, is buying machinery, tools, supplies and equipment for the Slave Falls power development.

Modern Table Co., 934 St. Catherine Street, Montreal, is having plans prepared by Gravel & Laliberte, 180 Ontario Street East, for a three-story factory, 20 x 72 ft., to cost \$35,000.

Matthews Conveyor Co., Port Hope, Ont., is arranging for an addition to cost \$20,000.

Canada Cement Co., Phillips Square, Montreal, contemplates spending \$1,000,000 on a plant at Quebec.

W. S. Tyler, 3615 Superior Avenue, N. E., Cleveland, Ohio, has purchased a site on Ontario Street, St. Catharines, Ont., for erection of a factory to manufacture woven wire screens, screening equipment, ornamental iron, bronze, etc.

Toronto Iron Works, Ltd., foot of Cherry Street, Toronto, is having plans prepared by D. Brouse, 514 King Street East, for a plant to cost \$500,000.

Curtiss-Reid Aircraft Co., 347 Craig Street West, Montreal, is contemplating erection of an airplane manufacturing plant at St. Laurent, Que.

Western Canada

Bids will be received by chairman of Committee on Public Utilities, Winnipeg, until Dec. 31, for manufacture, delivery and erection at Slave Falls, Man., of one 100-ton main lift and 20-ton auxiliary lift electric traveling crane complete.

Ingmika Mines, Ltd., Prince George, B. C., is having plans prepared by its own engineers for a hydroelectric power plant at Black Canyon, Finlay Forks, on Omineca River.

Manitoba Rolling Mills Co., Ltd., 875 Logan Avenue, Winnipeg, is having plans prepared by its own staff for a plant at East Calgary, Alta., to cost \$400,000.

Dominion Bridge Co., head office, Montreal, has acquired control of Riverside Iron Works, Calgary, Alta. Dominion company expects to spend \$300,000 on Calgary plant next spring.

Foreign

BIDS are being asked by Ministry of Public Works, Bogota, Colombia, to be received between Jan. 4 and 17, for machine tools and a locomotive turntable.

Municipal Government, Tokyo, Japan, is arranging for city improvements to cost 108,512,000 yen (about \$54,256,000), including construction at Tokyo Bay harbor, with docks, wharves, mechanical conveying and handling equipment, etc., to cost 27,900,000 yen (about \$13,950,000); extending and modernizing slaughter houses, with installation of equipment, to cost 1,500,000 yen (\$750,000); sewage

construction and improvements, including pumping and other machinery, to cost 33,300,000 yen (\$16,650,000) over 10-year period; and new commercial school at Kyobashi within 36 months, to cost 812,000 yen (\$406,000).

Government Railways of New Zealand, Wellington, will receive bids until Feb. 18 for machine tools, autogenous welding equipment, and a freight elevator.

Ford Motor Co., Ltd., London, England, recently organized to manufacture and distribute Ford automobiles in that country, is disposing of stock issue to total about \$14,000,000, part of fund to be used for new plant on 300-acre tract at Dagenham, England, to have initial output of 200,000 cars per annum; expansion in Manchester plant, to be used in future for assembling of new cars and manufacture of replacement parts for former models, and development of tractor plant at Cork, Ireland, for annual output of 30,000 tractor units. Henry Ford, Detroit, will be an official of new company; Hon. Roland D. Kitson, 3 Victoria Street, London, director of Bank of England, is also prominent in new organization.

Representing Government Railways of Colombia, Baldwin Locomotive Works, 500 North Bridge Street, Philadelphia, N. W. Semple, Jr., in charge, is said to be arranging for early purchase of machine tools and other equipment for locomotive repair and reconditioning shops at Cali, to cost more than \$1,500,000.

Officials of Union Oil Co. of California, Union Oil Building, Los Angeles, have organized a subsidiary, Compania Mexicana de Petroleo Union, S. A., to take over and operate oil properties in Miahaupon district, Mexico, to include installation of drilling and other machinery, pipe lines, loading facilities and other equipment.

La Union Metalurgica, Sociedad Anonima, Castillejos, 111, Barcelona, Spain, wishes to get in touch with makers of machines for threading augers such as are used by coopers, the augers being of the type which have a gimlet point.

A company at Warsaw, Poland, is completing plans for new soap manufacturing plant, to cost about \$2,500,000 with machinery, to be completed next summer. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference Great Britain No. 76089.

New Trade Publications

Tractors.—Atlas Engineering Co., Clintonville, Wis. Folder of six pages, illustrating and describing a tractor with driving and steering on all four wheels. Heavy lugs on the wheels are used on soft ground, whereas rubber shoes can be fitted for city work.

Cranes and Trolleys.—H. D. Conkey & Co., Mendota, Ill., Catalog No. 110. Contains 50 pages of illustrations and text describing types of trolleys and wall bracket and mast type jib cranes, push cranes, underhung and standard hand power and electric cranes and hoists. Specifications of standard equipment and the list prices subject to discount are given in each section. The booklet is printed in color and presents an attractive appearance.

Small Motors.—General Electric Co., Schenectady, N. Y. Bulletins GEA-71B and 81B illustrate and describe respectively wound-rotor induction motors of $\frac{3}{4}$ to 10 hp. and double squirrel-cage motors of 3 to 15 hp. Both are for three-phase or two-phase circuits and may be had for 220, 440 or 550 volts.

THE IRON AGE

New York, December 27, 1928

ESTABLISHED 1855

VOL. 122, No. 26

7500 All-Steel Toys a Day

Production Saves Auto-Body Scrap and Occupies Parts Manufacturer During Slack Season for Automobiles

AUTOMOBILES for grown-ups and for kindergartners form a combination that has solved two problems in the plant of Murray Ohio Mfg. Co., Cleveland. One was to find some way to keep the plant busy during seasonal lulls in demand for automobile stampings. The other was to find some use for the large quantity of high-grade sheet scrap that was being bundled and sold at a low price.

Pressed steel juvenile vehicles, manufactured as a side line, seemed to be a solution of these two problems. At the start, five years ago, only scrap metal was used for

these products, but the company's business in this side line has grown to such an extent that considerable auto body seconds now has to be purchased for toy manufacture. At present salvaged scrap represents about 30 per cent of the amount of sheet steel consumed in the toy plant.

From the standpoint of seasonal demand the two lines fit together admirably. A rising demand for automobile stampings usually starts in January but tapers off in June. During the following month toy manufacturing begins its seasonal activity, reaches its prime during August

First Steps in Making Steel Toys. Bigger stampings are made on presses at other times used for automobile doors or panels; this battery of small machines is used exclusively for minor toy parts

Spray Machine for Cleaning. Parts to have same color are sub-assembled, then cleaned, enameled and baked on continuous machinery adopted from best auto-body practice

and ends with November. Nearly all toys must leave the factory not later than Dec. 1 to reach retail stores for holiday trade.

In the past few years the public has been buying better and more lasting toys, toys that will stand up under hard usage. This tendency has favored American makers, who have to face the competition of inferior imported toys. American pressed steel toys also occupy a distinct field, as the German toy makers, who in the past have been the strongest competitors, center their efforts largely on what are known as mechanical toys.

Another favorable factor is the American mass production of pressed steel toys, as exemplified in the Murray Ohio plant, which results in a marked decrease in the cost of making a high-grade article. Thus the manufacturers have kept pace with the demands of the youngsters for toys that are equipped with most of the extras they see on grown-ups' vehicles. Some of the higher grade juvenile automobiles and trucks have such refinements as ball bearings on the rear axles, roller bearing front wheels and carbon steel springs, as well as the numerous accessories found on modern types of passenger cars.

Santa Claus's Assistants. Youngsters, rather than gray beards, having a good time building motorized "hook-and-ladders"

Starting to make juvenile vehicles five years ago as a side line, the Murray Ohio Co. has increased production of "Steelcraft" toys to an output of 850,000 pieces a year. These range from a sturdy all-steel coaster wagon or a juvenile automobile down to a tiny red cart a baby finds delight in pulling around the living room floor, and include all-steel juvenile trucks, airplanes, scooters, wheelbarrows and steam shovels. The company's maximum daily output is 7500 toys and shipments reach 6 to 7 carloads per day.

The scrap used in the toy department is largely 20 to 22-gage auto-body stock, although material as thick as 12 gage finds its way into front axles. Thus the \$5 toy automobile is made in considerable part of as good quality steel as a high-priced passenger car.

Scrap from automobile stampings goes from the blanking presses to a shear, where the pieces of sufficient size to salvage are cut off and the remainder goes to the baling press. Some of the scrap is left in a form difficult to handle and has comparatively small sections that can be used, so that it is not worth the time required to salvage it. However, from 50 to 75 per cent of the sheet material that was formerly scrapped is salvaged for the manufacture of toys.

The heavier stampings, such as frames, hoods and body parts for juvenile vehicles and tops for coaster wagons, are formed on the same large presses that are used in making automobile stampings, thus keeping the equipment busy when automobile manufacturing is slack. This is supplemented by a number of small presses for blanking and forming minor parts.

Stamped parts for toys all go from the presses to a stockroom or clearing house, and from there they are delivered to the sub-assembly department. Usually there are two or more colors on a toy vehicle, and the parts are sub-assembled according to the finish they are to have, in order that each portion may be enameled as a unit. Both

spot welding and riveting are used in joining the individual parts, welding being preferred. Power riveting machines of the tubular type are used.

The sub-assembly units are washed in a machine where they are first sprayed with a caustic solution, then cleaned and dried. Work is carried through this machine on a woven wire belt. After cleaning they go to the enameling department, where the parts are dip painted in enamel and hung on racks that carry them through a continuous baking oven. This is a double chamber oven having one chamber for black work and the other for red, green and blue. The black enamel is baked for two hours at a temperature of 450 deg. Fahr. Other colors pass through at a lower temperature and at a somewhat slower rate. The oven is equipped with automatic temperature control, and was built by Young Brothers Co.

Sometimes there is further finishing in colors, or striping is put on by hand. The sub-assemblies go to the final assembly room after painting, and when completed the toys are boxed and moved to the shipping department.

Some special equipment has been installed. The most interesting is a special welding machine for affixing tires. These tires, of solid rubber cut to length, have a wire running through the center and extending slightly beyond the ends. In one operation the tire is pulled tightly around a disk wheel and the protruding wire ends are welded in their lapped position. While this is being done the ends of the rubber are held back an inch or two from the joint. When the weld is completed and the wheel leaves the machine the two ends of the rubber tire spring together.

Toy airplanes are made in a separate department equipped with spot welding and riveting machines, a power hammer for driving on the wheels, and a special baking oven for drying the 20 parts after they are dip painted a light gray enamel. This enameling is done before assembling.

Fatigue Strength of Steam Turbine Blades

A STUDY of turbine blading has been made by Moore, Lyon and Alleman, University of Illinois Engineering Experiment Station, for Allis-Chalmers Mfg. Co. (Bulletin 183.) Short lengths of the blades were mounted in special chucks and rotated under load until failure developed from the alternating bending stresses. Failure started at the tips, usually at the thicker one, where the highest stress in bending occurred. Owing to the unsymmetrical shape of the cross sectional area, there were certain harmonic inertia effects to be evaluated; furthermore, the ordinary beam formulas required modification. After such corrections had been applied, the endurance limits of the drawn blades were found to be nearly as high as that of larger bars, machined to the standard round specimen. This conclusion is verified by experience with steam turbines.

Blades tested were of cupro-nickel (80:20), monel metal, and cyclops metal No. 17 (a 0.50 carbon steel containing 19 per cent Ni, 75 per cent Cr, and 1 per cent Si). Since there is a fairly close relationship between hardness and fatigue resistance, this ratio was computed for previously made tests on materials of this analysis. Fatigue strength of the blade material in round specimens was then computed by means of such ratios and hardness tests taken

on the blades. (The blades were too small to produce round specimens.) Numerical results are given in the adjoining table.

Fatigue Strength of Steam Turbine Blades

Metal	Brinell Hardness	Ratio Endurance to Hardness	Computed Endurance of Blade Material	Actual Endurance Limit of Blades
Cupro-nickel	117	166	19,400	20,000
Monel metal	212	190	40,200	37,000
Cyclops metal	171	250	42,800	42,500

Graft in Selling and Purchasing

Boycott is the best remedy which can be found to cure that commercial bribery which yet exists between unscrupulous selling organizations and purchasing agents (or those who specify purchases), in the opinion of M. Q. MacDonald, writing in *Purchasor*. If honest purchasing agents (which means 99 out of 100) would refuse to do any business on any price basis with concerns offering bribes to them, and cut off all commercial relations with concerns which have been publicly exposed or admit such practices, the selling graft would rapidly lose popularity because it would cost too much in lost and unapproachable business.

Progress in Iron and Steel Work

Engineering Features Receiving Most Present Attention
Are Outlined Before A. S. M. E.

SPEAKING for the executive committee of the Iron and Steel Division of the American Society of Mechanical Engineers, George T. Snyder, chief engineer National Tube Co., Lorain, Ohio, and chairman of the committee, presented on Dec. 7, at the annual convention, his report of the year's progress. It was in part as follows:

Open-Hearth Furnaces

Development in open-hearth practice has not shown any radical departure in general design of furnaces or equipment. It is rather along the line of refinements, such as preheating air, insulating walls of chambers, sloping back-walls, greater recovery from waste heat in gases, and, of course, continued efforts to improve quality. As one writer puts it, "future trends will be toward larger furnaces aiming at greater tonnages and lower costs, efforts to secure more refractory linings, better utilization of present sources of heat, and better control of atmospheric conditions." There is also the question of mixing blast-furnace and coke-oven gas to secure enormous volumes of a gas sufficiently rich to serve the open-hearth as well as other metallurgical furnaces.

Multiple pouring of ingots is being used to a greater extent, and advantages are claimed. The equipment for multiple pouring requires careful mechanical designing, to be safe and effective. It is sometimes difficult to accomplish in existing plants, for lack of headroom or other clearances.

Tilting open-hearth furnaces are preferred in many cases and are being advocated for the well-known advantages of slag control, tapping, control of steel quality, and ability to patch bottoms. The mechanical equipment controlling the tilting of these furnaces seems to be entirely satisfactory.

Insulation of checker chamber walls has been much discussed, and there are many advocates. It is to be hoped that, where applied to old furnaces, these will be analyzed in all cases by careful tests prior and subsequent to the installation. The use of fans at each end of the furnace to secure better combustion control is being tried, and satisfactory results are claimed.

In England at the Merchant Iron Works Co., Middlesbrough-on-Tees, Benjamin Talbot installed an auxiliary hearth to an open-hearth furnace. This device is used to preheat the metal, be it scrap or hot iron, before it is discharged into the main hearth. It is claimed that a material increase in the output of the open-hearth furnace is thereby obtained.

Bessemer

Many mechanical improvements are possible in a new Bessemer plant, such as electric tipping, scrap charging, provision for double pouring, delayed teeming, and incidental equipment needed to reduce loss. A small amount of study and attention might increase the proportion of steel made in converters. That there are many uses for this kind of steel is well known, and improvements in the practice might readily extend these uses.

Duplex Plants

While satisfactory steels are being made in duplex plants there does not seem to be much development in the way of additional plants. The large tonnages possible make this manner of making steel attractive, although there are

numerous difficulties to be encountered and great care must be taken in the selection of metal, fuel, temperature control and preliminary blowing.

Sheet Mills and Sheet Bar Mills

Continued interest is shown in the new mills which have been built during the past two or three years. F. C. Biggert, Jr., says: "If present indications are borne out by actual experience, we may expect to see sheet steel selling at prices sufficiently reduced to make possible its use for a multitude of new purposes. It should be noted, however, that this has not yet been accomplished. The new mills represent large investments and require large tonnages and large individual orders to make their operation profitable."

From an operating standpoint they are still in an experimental stage, and it is doubtful if any of them has yet shown costs lower than can be made by established methods. The following pertinent statement has been made: "Another phase of interest in this portion of the steel industry is that most of the inventions and discoveries necessary for the successful operation of the new method have been covered by patents, possibly to a greater extent than any single industry save perhaps that of wire. The rolling process and machinery and the subsequent processing, annealing, pickling, etc., all come within the scope of this protection. It would be unfortunate indeed if the situation were handled in any but the broadest, fairest manner, for which the leaders of the American steel industry are eminently fitted."

Of passing interest is the rolling in one of the American Sheet & Tin Plate Co. plants of 48-gage tin plate which "can be torn easily between thumb and forefinger." The field for the use of this very thin material is said to be limited, but its availability may develop additional uses.

The importance of progress in the art of rolling sheets is shown by the progressive development made by Weirton Steel Co. in the three periods, 1916-1920, 1920-1925, and 1925-1927, in which horsepower progressed 4900 hp., 6300 hp., and 8500 hp., respectively, and monthly tonnages, also respectively, 8365 tons, 11,386 tons, and 13,658 tons, rolling 18-gage 5 to 6½ in. to 11-gage 5 to 22 in.

Coke Plants

Dry-quenching of coke has not made much headway in this country during 1928. The claim of a saving of 5 per cent or over 2,000,000 tons of coke per year should encourage further investigation and, if established, promote this project of cooling by continuous passage of inert gases through the coke and reclaiming the heat so absorbed by producing steam.

Rolling Mills

Additional items of interest in regard to the new mills at the Homestead works of the Carnegie Steel Co. are available. It has been pointed out that the construction of these large and modern mills on sites occupied by old mills that continued to operate called for what may be termed "emergency engineering" and for great resourcefulness upon the part of all who had anything to do with this project.

There is a dual set of mills running parallel, with motor room between and soaking pits at the end, arranged so that ingots can, when required, be fed to either mill. The buildings covering these mills are said to weigh nearly 27,000

tons and cover more than 1,000,000 sq. ft. The weight per square foot of floor space covered seems to figure out over 47 lb., which denotes very substantial construction for buildings of this type.

While this group of mills was designed for 26,000 tons a month, it is expected this will be greatly exceeded, which is not surprising, since designed tonnages in all kinds of rolling mills seem always to be exceeded, and sometimes soon after they are placed in operation.

Seamless and Welded Tube Mills

Development of this branch of the iron and steel industry has been rapid, and competition is keen. Whether to build pilger mills or some other kind seems still to be a question, and advocates of both types can undoubtedly point to finished production that satisfies customers. The combination of piercing and expanding mills followed by the usual equipment points to still larger diameters than are now being made. The enticing features of pilger mills, while calling for some elaboration in the open-hearth plants, will continue to attract attention and probably promote more mills of this type.

By-passing soaking pits, a blooming mill, and a bar mill for rolling rounds is an attractive idea that will continue to be alluring. Mr. Stiefel, however, who should be an authority in the whole field of seamless-tube making, says: (1) Output in tons with plug mill is two or three times greater; (2) cost of installation about the same; (3) tool cost of pilger mills two or three times greater; (4) rolls and mandrels for the pilger mills call for special steels; (5) maintenance and tool equipment less costly for plug mills; (6) plug-mill product is of better quality; (7) pilger mills can roll longer lengths; and finally, (8) plug mills will probably be built that can produce tubes 24-in. in diam-

eter. The controversy, if there is one, must resolve itself into the question of cost to produce from start to finish.

Blast Furnaces

The large furnace up to about 25 ft. diameter hearth is considered good practice, and satisfactory operation of these stacks, as large or nearly as large as this, at about 850 to 900 tons of iron a day (average), is not unusual. No important improvements to stack, skip, or stoves have been noted, the changes, if any, being in details. Considerable attention has been given by blast-furnace operators and designers to the matter of gas cleaning. This matter and the ever-present problem of flue-dust production and disposition are sufficient to occupy the minds of furnace operators between casts and deserve much thought and study.

Blast furnace practice must improve, according to various authorities, through the use of better burdens, large furnaces to secure low costs, better gas cleaning to secure good results at consuming units, and the recovery of the iron content now lost in wasted flue dust. Improvements in equipment for the recovery of the iron content in blast-furnace flue dust, either by sintering or by some other method, point to the possibility of large blast-furnace operators facing a penalty, in addition to the yield loss, for all dust wasted beyond the amount known to be recoverable.

Attention was called early in the year to the German achievement of operating a blast furnace at 1000 tons a day, largely through selected burdens. They have used sintered fines from the ores, a practice which may show results in this country far beyond present conjecture. Quoting from an article printed in February this year: "Large American furnaces, if supplied with rich sintered ores, would produce far more than anything yet achieved here or abroad."

Management Engineering in Small Plants

Problems of Production Control and Grouping and Classification of Equipment; Importance of the Operating Personnel

BY J. E. DYKSTRA*

MAN POWER in industry can be directed to its highest state of efficiency only by proper guidance and proper planning. Production methods have received more attention from management engineers than have methods of selling and distribution and design. Standardization in design may well be given some consideration by plant managers, especially in plants where the product is greatly diversified and quantities are limited. If standardization of parts is given the attention it deserves, it will at once have a tendency of bringing parts through the plant in greater quantities.

Certain factors which make for efficient operation, in the order of their usefulness in establishing a workable system not entailing too great a cost to the average small industry, are:

1. Production control;
2. Grouping of equipment and its classification and possibilities of modern equipment;
3. The personnel or man power that makes successful operation possible.

Production Control

Production control can be separated into such main items as proper scheduling, routing, stores control, costing and purchasing. Many obstacles are frequently encoun-

tered in the smaller shops due to the limited quantities and the dissimilarity of parts that must often be produced by the same machinery, but machine-tool builders have demonstrated that many standard machines have built into them the possibility of caring for greatly diversified products, simply by equipping the machines with suitable fixtures and jigs. Proper scheduling can frequently be enhanced, however, by noting the requirements of the sales department over a few months.

To determine the production capacity of various departments it is essential to study in considerable detail the suitability as well as the grouping of the equipment to produce the desired part. In most cases similar equipment can be grouped together profitably for lighter machining operations. In our present age of specialization, better supervision is obtainable if lathes, turret lathes, screw machines, milling machines, etc., are grouped in their respective classes. On the heavier classes of work it is best to arrange the necessary equipment in the same sequence as the operations to be performed; in this manner the operations can usually be completed in the smallest space, with elimination of unnecessary moves.

Proper Routing

Proper routing of parts through the factory is obtainable only by keeping in mind the fact that material, when once it has left the stockroom, should travel in the gen-

*Factory manager, Champion Co., Springfield, Ohio. This is abstract of a paper read Dec. 6, at the annual meeting, New York, of the American Society of Mechanical Engineers.

eral direction of the assembly or finished-stores department, accompanied by an identification tag showing the sequence of operations as well as the departments that are to perform the work. This can most easily be accomplished by placing at the production-department's office a set of master route cards which show the sequence of operation and the various operations themselves.

To aid the department foreman as much as possible it is highly desirable to furnish the departments with proper descriptions of all operations to be performed on any one piece. These operations, readily designated by their numbers, should appear on the operation card in logical sequence. A full description of the operations to be performed should be on this card and the tool numbers of the fixtures and tools needed should be given.

Proper Costing

Almost every factory manager will agree that proper costing is a prime necessity in all departments of his plant. The mainstay of proper costing is the establishment of a time study to determine (1) best possible tooling requirements obtainable with production requirements, (2) methods of determining the time required to perform the various operations with the equipment available, and (3) an accounting of all time spent on any job.

Minimum costs are obtainable only through a system which accounts for every minute of the day that is spent by the employee in the shop. The psychological effect of knowing that every minute is recorded is generally conducive to the best effort. A simple job ticket giving the symbol of the part, together with a lot and shop order number, can be made out in the office at the time the material is ordered. It then is necessary for the department foreman only to fill in the name of the employee and the number of the machine used for the operation. This ticket, stamped at the beginning and completion of the work by the employee himself, can then be used for both progress report and costing purposes.

In considering the tooling possibilities it is always necessary to consider the tools available and the time required with these tools. With this factor known it becomes comparatively easy to determine the possible savings with more elaborate fixtures. While the more elaborate fixtures are invariably considered from a cost-reducing standpoint, it is well also to bear in mind the increased accuracy which such fixtures usually bring about, thereby frequently reducing the assembling cost of the product.

Grouping and Classification of Equipment

With any well-thought-out scheme of production control it is always necessary to provide for such emergencies as "breakdowns" of equipment. Almost every machine tool in any plant carries a designation number and these machine numbers should be carried on the departmental operation sheet as well as the time-study sheets. This at once guides the department foreman in distributing his work on hand in the departments. By grouping the machines of similar capacity and adaptability to certain work it provides at once a means for him, in case of necessity, to shift the work on hand to other machines that fall under the same classification. This gives a desired flexibility of operation not otherwise obtainable.

The possibilities of modern equipment are usually not well enough known to many factory executives. It is difficult for the department head of a factory where quantities are small to show a sufficient saving on any one product to justify the expenditure required for the purchase of modern equipment.

Many pieces of equipment in the average smaller industrial plant would be replaced by modern tools if the executive but knew their production possibilities. Many tools would be discarded as readily as the car model of a year or two ago if modern equipment were considered in terms

of saving of man-hours, instead of saving in dollars and cents per unit produced, as is most generally the case.

A new up-to-date machine tool will usually save a considerable amount of time, compared with a machine a few years old, and the accuracy obtainable with the more modern machine tool is always reflected to a considerable degree in the erection or assembly costs. In spite of this common knowledge regarding modern machine tools, many shops have entirely too much equipment which, while useful, is not profitable when compared with the producing possibilities of the new machine.

While the saving possible in actual labor cost on a given product may not loom large, the fact remains that wherever a new machine is 20 or 30 per cent more efficient than the old one, the operator's effectiveness is increased to that extent. If, therefore, the average machine tool in a shop is 20 per cent less efficient than the new tools, it follows that a 20 per cent reduction in payroll could be effected by the use of the new tool.

Executives of many smaller plants fail to realize the fact that the best modern equipment pays well, even if it is difficult to show up beforehand in dollars the resulting savings, not only in the machining, but also in the subsequent assembling operations. Facts bear out the assertion that in general new equipment materially reduces the departmental overhead, through the absence of repair costs and shutdowns, but also usually decreases the general unit overhead by increasing sales that the better product often makes possible.

Man Power

Engineers should remember that the human element is not subject to the rule of cold figures. While the analysis of possibilities of the human element involved should be and is one of the mainstays of our planning as management engineers, we should ever bear in mind the fact that those directed by us can be taken over many obstacles if properly led. Industry on the whole and engineers as well have been slow to recognize the value of competent leadership.

While there are, no doubt, many men who work neither for money nor fame, but for the joy of the working, as Kipling put it, facts amply testify that in general all human endeavor is directed toward the reward that it brings. A cost-reducing plan, therefore, which does not bring its rewards and its encouragements to those who carry it out, will never attain its full possibilities.

Improvements Possible in Most Plants

Many opportunities for improvement in operating conditions in plants are neglected because of inertia in the management, according to George E. Hagemann, associate editor *Manufacturing Industries*, New York, who led the discussion on Mr. Dykstra's paper. Evidently, if best results are to be obtained, delegation of authority is essential. A company employing 300 or 400 men was cited, in which each foreman has a capable assistant who can run his department at any time it is necessary. This not only provides for accident, both physical and otherwise, but it permits the foreman to go out, when occasion arises, to inspect machinery or appliances and other equipment which are on order for the plant, and shortly will have to be used in that foreman's department.

Improvements in production control, while perhaps more to be expected in the small plant than in the large, are by no means so confined. The large plant has great opportunities for improvement, in almost every instance.

Another speaker stated that engineers in charge of design have not yet reached that peak of efficiency in their designs which is needed by progressive management. Especially is this true with regard to the standardization of parts, such as can be used for a variety of purposes by a concern doing what is essentially a jobbing business.

Adds Cold-Rolled Strip Department

Sharon Steel Hoop Co., as Part of Its Modernization Program, Completes Cold-Rolling Plant

ABOUT a year ago the Sharon Steel Hoop Co. acquired approximately 11 acres of ground adjacent to its Sharon, Pa., plant. This area now is largely occupied by modern mill buildings housing new pickling and galvanizing departments and a cold-rolled strip plant. The new construction marks the first major step in a complete modernization of the Sharon plant, and when, a short time ago, the first cold-rolled strip steel came off the new mills, the company entered the ranks of manufacturers of that product. As its name suggests, the company first was engaged in the manufacture of hoop steel and in the days of the wooden barrel was a large factor in the production of the narrow flat bands used by the cooperage industry. When the Southern cotton grower depended largely upon Northern mills for ties for baling, the company was one of the important sources of supply.

The plant, since its construction in 1900, has been devoted exclusively to the rolling of flat light-gage steel. With the rise of the motor vehicle industry, with its numerous and increasing uses of light-gage flat steel, the decline in the use of similar steel for cooperage purposes, and, on account of foreign competition, the passing of a profitable market in cotton ties, it is to be taken as an evidence of a forward looking management that the company several years ago stopped making cotton ties and went more strongly into the production of the steel called for by the automotive industry.

Out of the effort to distinguish the requirements of the motor car builders from those of other consumers developed the term "strips." The company still is a producer of hoops and bands, but with its new productive facilities, it is to be reckoned as essentially a maker of strips. Its entry into the field of cold-rolled strip steel has the backing of a record of 28 years in the rolling of hot-rolled flat steel.

Under construction at present as part of the moderniza-

tion program is a continuous, electrically driven, hot strip mill, which is expected to be in operation by next March. Electrification of the plant has been another important development. One of the impressive features of the new plant is its skillful tie-up with the older sections of the works and the remarkable ease with which steel coming from the hot mills is transferred either to railroad cars for shipment or to the pickling department preliminary to further finishing.

The new structures are of notably solid construction, the columns being almost wholly of heavy single piece H beams. On account of the closeness of the plant to the Shenango River, there was a soil condition which had to be met to insure solid foundations. Besides the use of concrete piles, there is a 4-ft. bed of tamped slag topped by concrete in which have been laid creosoted wood block floors. There is an air of solidity and permanence to the new structure, and lighting and ventilation are of the character which helps to make the working place attractive. The efficiency of the plant has gained appreciably, as the records of the plant since completion of the new section show that a larger tonnage is being turned out with one less working turn per week.

The 8-in., 9-in., 10-in. and 14-in. hot strip mills, which have been in operation for a number of years, parallel each other, as shown in the accompanying plan. These mills discharge their strip, either in cut lengths or coils, into the No. 1 loading building. From this building the strip is either loaded directly into the cars or taken to the No. 2 loading building or the pickle shop storage building, by roller bearing trucks and tractors.

From the pickle shop storage, the coils in sizes up to 10 in. wide are fed through continuous pickling tanks, washers, dryers, and then to multiple head coilers. The wide coils and the cut strip are put on special Monel racks

Stands of the 10½ and 21¼ x 26-In. Cluster Mills, Together With Reel and Coiler

and handled by cranes into pickle and wash tanks, then to dryer or roller levelers and oiling machines.

There are two sets of continuous pickling tanks. The first set will handle eight rows of strip in widths up to 6 in. This set consists of one long pickle tank, water, muriatic acid and lime tanks. There is also a pull-up machine for galvanizing, and a galvanizing pot, which is fired with natural gas.

From the galvanizing pot the strip is fed to an eight-head coiler. Each head is provided with a small roller leveler, which takes out any corrugations that may have developed in the strip in the hot mills or during the pickling. The heads on this coiler are driven with individual motors, which have a variable speed of 6 to 1 and there is also a 2 to 1 gear shift, giving a total speed change of 12 to 1. The strip is pulled through the tanks by this coiler at a constant speed by means of an automatic control which slows the motors down as the coils increase in diameter.

rewinders, polishing machines, oiling machines and shears.

The first roughing mill consists of four stands of 10½-in. and 21¼-in. by 26-in. cluster mills set tandem, about 15 ft. center to center of stands. These mills are driven by 200-hp. variable speed motors, on each pass, and the delivery speed ranges from 125 to 375 f.p.m. It is possible to control the complete mill from any stand, by means of push buttons.

The reel and coiler are driven by variable speed motors and are synchronized with the mill. The reel on the cluster mills mentioned can be adjusted for a maximum pull of 4600 lb. The other reels have maximum pulls in proportion to the sizes of the mills.

The coilers are of the five-roller type, with special guide rollers for holding the coil in place, during the coiling operation.

The second roughing mill includes three stands of 8½-in. and 16½-in. by 18-in. cluster mills, set tandem at about

A 10½ x 18-In. Finishing Mill With Accompanying Reel

The second set of continuous pickling tanks are about the same as the first except that they are wider and will handle 16 pieces of strip. There is no galvanizing pot in this set. The coiler has 16 heads. Every other head will coil strip up to 10 in. wide and the alternate heads up to 6 in. wide.

The coils are loaded on trucks by cranes at the coilers and then taken either to the cutting up machines, to the cars for shipping, or to the cold-roll plant.

There is a loading dock along the east side of the pickle and cold-roll plants over 1000 ft. long. Part of this loading building has a crane runway for open car loading. Between the pickle and cold-roll plants there is a covered runway so that the pickled strip is never exposed to the weather.

The cold-rolling plant is about 250 ft. north of the pickle shop. This intervening space is reserved for extensions to either of the plants. The rolling equipment consists of three sets of tandem roughing mills with reels and coilers and complete handling equipment for material and rolls. There are seven sets of finishing mills with auxiliary equipment the same as the roughing mills. Other finishing equipment consists of slitters, roller levelers, edging mills,

15 ft. center to center of stands, and with reel and coiler. A fourth stand about 35 ft. from the third, with 8½-in. and 16½-in. by 26-in. rolls, is set in tandem, so that it can be used with the other three stands or can be used as a single mill. It also has a reel and coiler. This mill is driven with 150-hp. motor on each stand.

The third roughing mill is a three-stand tandem, two-high, mill with 10½ x 10 in. rolls. This mill has a set of driven edging rolls before the second and third stands for the purpose of producing square edge material. This mill has a reel and coiler, the same as the other mills.

The finishing mills comprise two stands of 13 x 18-in. rolls, two stands of 10½ x 18-in. rolls, two stands of 8½ x 10-in. rolls and one stand of 18 x 26-in. rolls. These mills are all equipped with variable speed motors. The reels are also driven with variable speed motors with adjustments for variable tension on the coils. Six of these mills are equipped with edgers which are driven from the mill motor.

All of the mills are equipped with roller bearings. The cluster mill bearings are Timken and the two-high mills are Rollway. The cluster mills and the 18 x 26-in. finishing mills have motor driven screwwdowns, with a motor on

Multiple Head Coiler Used in Connection With the Continuous Pickling

each screw, and a magnetic clutch between the drives, so that the screws can be operated separately or together, as desired, by a system of push button control.

The auxiliary equipment consists of slitters, portable coilers, polishers, roller levelers, portable shears, oiling machines and scrap bundling machine. All of this equipment, which, with the mills, was built by the E. W. Bliss Co., has a capacity for making cold-rolled strip any gage up to $\frac{1}{4}$ in. thick and any width up to 22 in.

A roll grinder, furnished by the Norton Co., has equipment for grinding the barrel of the rolls either straight, concave or convex.

There are three flying shears, built by the Hallden Machine Co., which will straighten and cut the finished strip in any length up to 16 ft.

The annealing department equipment consists of four double, box annealing furnaces, which are hand fired. There are cast steel annealing boxes and bottoms, and the necessary equipment for drying and handling the gas to the boxes. A 50-ton crane serves an annealing bottom with the charge and cover complete.

In the annealing furnace building there are two Leif Lee heaters, which furnish the heat for the cold-rolling plant. These are located so that the coal and ash handling equipment can serve them in the same way as it does the annealing furnaces. This equipment includes a track hopper and coal elevator, which discharges coal into boxes or ashes from a bin into a standard car or truck. The coal boxes are moved by an overhead crane to the different furnaces and the ashes are taken from the furnaces by this same crane to a bin adjacent to the coal elevator.

Another addition to our rapidly growing list of technical handbooks is a 383-page volume just issued by the American Oil Burner Association, 342 Madison Avenue, New York. It was edited by Harry F. Tapp of the association. It is intended to supply to those interested authoritative information concerning problems of combustion and heating, as needed in the practical application of oil-heating equipment. The volume, which is priced at \$3, is in flexible binding and thin paper so that it will fit the pocket.

Reheating Furnaces for Alloy Blooms

Soaking Chamber Forms Part of Furnaces Designed by
Timken Company—Hearth Has Three Zones
—Refractory Recuperator a Feature

RHEATING high-quality alloy blooms on a quantity production basis has been provided for at the new mill of the Timken Steel & Tube Co., Canton, Ohio, by the installation of two large continuous reheating furnaces, especially designed for the work. The furnaces are of the triple-fired, recuperative type, using natural gas for fuel and having a capacity of 40 tons per hr. each.

Blooms are brought directly to the charging end of the furnaces by a live roll table running from the main transfer table and are pushed through the furnaces by means of a motor-driven pusher mechanism. Due to the quality of the steel, extreme care must be taken in the heating of these blooms, which accounts for some of the features in the design and construction of the furnaces. Upon entering the furnaces, the blooms are gradually warmed in a 10-ft. dead end, next passing through the channel and main heating chamber, and last receiving their final soaking at a temperature of approximately 2200 deg. Fahr. on a brick hearth. From this hearth the blooms are discharged by gravity directly to a second run-out table that carries them to the 28-in. mill which serves as roughing stand for subsequent rolling operations.

These furnaces are the first of their kind ever built and put in operation, and incorporate a number of interesting features in construction and design. As they are precisely alike in all details, a description of one will serve for both. In over all dimensions they are 67 ft. long, 33 ft. wide and 26 ft. high at one end and 27 ft. 9 in. at the other,

above foundations. The hearth is 63 ft. long and 20 ft. wide with a roof height that varies from 3 to 7 ft. The furnaces extend a maximum of 15 ft. below ground level.

The section shown in one illustration gives an idea of the construction and general arrangement of the furnace interior. The main furnace chamber is divided into three zones—the first for gradual warming, the second in which the main heating is done, and the third, which consists of a soaking chamber for equalizing heat throughout the bloom before discharging. The latter compartment, the soaking chamber, is one of the features in the design. In this chamber, only sufficient fuel is fired to supply radiation losses and maintain the entire soaking hearth, side-walls and roof at constant discharge temperature. Practically no heating is done here, this chamber being used to equalize the temperature throughout the steel and to soak the entire bloom to the same heat condition.

The soaking chamber accomplishes two important things. First, it serves to insure even heating of blooms, removing dark spots caused by contact with water-cooled skids in the heating chamber; and second, it makes independent of each other the temperature condition of the steel and the tonnage output. Due to the soaking chamber, tonnage output can be changed at will by adjusting the burners located back of the soaking hearth without in any way affecting the quality of heating found in the discharged blooms.

The roofs on all three chambers are of flat arch construction, supported from overhead girders. This type roof

Cross Section of Continuous Furnace, Showing Arrangement of Heating Compartments and Recuperator

General View of the Two 40-Ton Reheating Continuous Furnaces for Alloy Steel Blooms

for wide furnaces such as these is found to make for uniform flame distribution and heating throughout the 20-ft. width of the furnace.

The entire length of the furnace chamber is liberally provided with working and inspection doors located in both side walls, care having been taken, however, that the doors be thickly lined and tightly fitted, to eliminate heat losses from the furnace interior.

Hearth Construction of Three Sections

The construction of the hearth proper is also somewhat unusual. Taken as a whole, it may be considered as divided into three sections, according to construction. The first section, which extends from the charging door to a point 27 ft. into the interior, is of standard firebrick construction. Extending along its length are four firebrick piers, on which are mounted the skids on which the blooms slide. These skids are water-cooled, the skid proper consisting of two concentric steel pipes. The inner carries cooling water to

the extreme end, the return being made through the outer. The pipes are all connected to a common header, so that there is a continual circulation of water through the system.

In the second section of the hearth, as can be seen from the drawing, the brick supporting piers are dropped away from under the skids, which are supported by cross pipes bent to a rectangular form. These pipes are of the same construction as the skid pipes, and are supplied with water from the same header, forming part of the general closed circulating system. This hearth construction has been adopted to provide combustion space for the burners firing beneath the blooms and to permit ready circulation of the heat below the steel, so that the cooling effect of the skid pipes will be minimized and the soaking period reduced when the blooms reach the soaking chamber.

The hearth in the third section is of solid firebrick construction, steel bars set almost flush with the firebrick taking the place of the water-cooled skids. The lintel of

Motor - Driven Pusher Mechanism for the Two Furnaces. The centralized control is shown at upper left

the discharge door is also water cooled, to form a rigid front wall support across the 20-ft. span as well as to carry the hinged doors. The discharge doors consist of a number of hinged steel plates that are swung outward by the impact of the blooms against them.

Three Tiers of Burners Provided

As the triple-fired name implies, there are three tiers of burners incorporated in the heating system of this furnace. One tier is located at the discharge end for maintaining the soaking chamber at the desired temperature. The other two tiers are located behind the soaking hearth, one firing above the blooms near the roof of the main heating chamber and one located below the level of the hearth, firing beneath the blooms. These two latter tiers determine the tonnage output of the furnace, the intensity of the heat from this point back to the charging door being controlled to give the proper temperature for any desired tonnage output.

Between the two heating compartments the flat arch roof is lowered to form a restriction to the flow of gases from the soaking chamber into the main heating chamber. This restriction is a very important point in the design of these furnaces since it makes possible the maintenance of a slight pressure in the soaking chamber to prevent the infiltration of cold air up the discharge slope through the flap type discharge doors. It is extremely important that scale losses be kept low, due to the cost and quality of alloy steel. The infiltration of air and resulting oxidation so noticeable on the ordinary type of end-discharge furnace is reduced to a minimum by means of the lowered roof between the soaking and heating chambers.

Control to Be Made Automatic

The control of the main heating system is manual at the present time, but is to be changed over in the near future to an automatic fuel-air proportioning system working in conjunction with an automatic draft regulator.

The highest flame temperature obtained in this type furnace is found in the main heating chamber back of the hearth, where the steel is being rapidly heated and where the tonnage output is controlled. The main heating cham-

ber ports are so arranged as to use highly preheated air with the natural gas fuel. Since the steel is colder at this point of the furnace than in the usual design of end-discharge furnace, it is possible to adjust the temperature so as to bring about an extremely rapid heat transfer to the blooms, thus increasing the heating efficiency of the furnace without detracting from the high quality of the heated product.

Refractory Tile Recuperator Under the Furnace

The pre-heated air is delivered to both the main heating chamber tiers of burners under positive pressure by the refractory tile recuperator, which is situated beneath the furnace proper and is arranged in three units. The central recuperator unit furnishes its preheated air to the under-fired burners; the two outside recuperators deliver preheated air to the overhead firing ports by means of two steel ducts which are insulated and brick lined.

The waste gases travel through the furnace to the down-takes 10 ft. from the charging door where they are led beneath the hearth to the three recuperators. The heated gases travel horizontally through the recuperators, making three passes, each successive pass being at a lower level until the gases are discharged from the recuperator to the stack flue at a temperature of approximately 700 deg. Fahr. The heat given up by the waste gases in passing through the recuperator heats up the hollow refractory tile through which air for combustion is passing vertically upward.

A collecting chamber is situated at the top of each recuperator unit, where the air is collected from all the ducts of each recuperator and thence led to the main heating chamber firing ports.

Blooms are charged to the furnace directly from the runout table by a double rack type pusher. A general view of the pusher is shown in another illustration. The motive power is supplied by a 120-hp., 220-volt, direct current, mill type motor, which is directly connected to a reduction unit common to both rams. The total reduction of speed is 83 to 1, giving a ram speed of 17.4 ft. per min. The load capacity of each ram is 82,000 lb. horizontal push. The shafts of all pinions, gears, and idler gears throughout the drive including the rack pinion, are mounted in Timken bearings.

Diffusion of Solid Carbon Carburizes Steel

CARBURIZATION of iron and steel occurs when the metal is heated in contact with solid carbonaceous materials, or with carbon monoxide or methane gas or melted cyanide. Two theories have been advanced to explain this action. One is that a gas, such as carbon monoxide is the carbon carrier; it diffuses into the steel and reacts with the iron to form cementite according to the reversible reaction.

The other theory is that the gas is decomposed by contact with the surface of the metal, depositing carbon soot which then diffuses atom by atom into the hot iron, entering the solid solution as austenite.

Experiments Support Decomposition Theory

The latter theory is supported by recent experiments by G. Takahashi, published in *Science Reports*, Imperial University, Sendai, Japan, July, 1928. He finds that a pure iron tube with 1 mm. wall evacuated inside and stoppered, and then bathed outside in CO at atmospheric pressure, is carburized throughout to about 1.5 per cent carbon in 10 hr. at 1000 deg. C., but the gas pressure inside has crept up meanwhile to only 80 mm. Almost complete decarburization was effected in similar fashion with CO₂ but the interior pressure rose to only 92 mm. Other experiments showed that hydrogen diffuses through the hot tube walls readily, but CO, CO₂ and N hardly at all. If,

therefore, deep seated carburization readily occurs while CO gas is penetrating but slowly, the effect must be due in most part to diffusion of solid carbon. This conclusion is also in line with x-ray studies of austenite, which indicate that carbon is dispersed within the interspaces of the iron lattice as carbon atoms and not as the compound Fe₃C (cementite).

Eye Accidents and Industrial Eye Strain Increasing

"Safety first" has brought down the number of accidents in industry to a gratifying extent, but the most distressing kind—preventable eye accidents—still comprises the most serious industrial hazard, according to Lewis H. Carris, speaking before the Safety Congress, Syracuse, N. Y., Dec. 6. Furthermore, the number is on the increase. He estimates that American industry pays \$10,000,000 yearly compensation to blinded workmen, and the loss to them and their families is much greater. Eyestrain from dark working places or from glare is more prevalent, and represents an equal economic loss, although it does not figure in compensation statistics. The remedy is constant use of approved goggles, helmets, and scientific lighting, and an informed cooperative attitude between employers, workmen and the medical profession.

Causes of Failure of Coiled Springs

Corrections Determined for Design Tables—Rough, Decarbonized Surfaces Detrimental—Mild Corrosion to Be Avoided

A SPECIAL research committee of the American Society of Mechanical Engineers, under the chairmanship of J. K. Wood, has fostered a number of researches into the properties of springs. Definite results have been obtained in some lines, and were reported at the general meeting early in December.

It is common experience that heavy, closely coiled helical springs—such as used in railroad rolling stock—frequently fail even though working under loads well within the supposed safe limit. The common type of failure is a detail fracture starting at the inside of the coil; it is usually attributed to faulty heat treatment. A. M. Wahl, research laboratory Westinghouse Electric & Mfg. Co., East Pittsburgh, analyzed the stresses by approximate methods, then performed tests on loaded springs and spring segments

in opinion many avoidable defects originate in a poor ingot surface (due to splashes, surface segregates or thermal stresses), persisting through to the round rod from which the spring was made. An even greater danger to the finished spring is the thin decarbonized surface left after rolling, coiling and heat treatment. The gross result is that the most highly stressed fiber in a spring is least able to withstand its load because of faulty mechanical and chemical conditions.

Corrosion Reduces Endurance Limit

D. J. McAdam, Jr., metallurgist United States Naval Engineering Experiment Station, Annapolis, Md., has co-operated with the committee in determining fatigue limits of spring materials under various conditions. His results confirm the general discoveries already made for other materials; namely, that the endurance limit (defined as the alternating load which can be withstood indefinitely without fracture) is proportional to the ultimate strength, but only when the metal is protected from corrosion. Since the strength of spring steel is much higher in its quenched and tempered condition than in the annealed state, it would be surmised that a properly heat treated spring could endure correspondingly higher vibrating loads without breakage than the metal would in a softer temper, and actual tests show this to be true. However, McAdam's experiments also show that this advantage is more than lost if the metal is subject to such mild corrosive action as running tap water; furthermore, that a notched specimen, hardened, has an equally low endurance limit to a notched annealed specimen. If a spring therefore is to withstand changing loads, as in railroad service, the importance of making it of a smooth bar and of protecting it from corrosion can hardly be overemphasized.

Correction Curve for Spring Tables

Divide coil diameter by wire diameter, run up on corresponding ordinate to curve, then across to left and read factor. Multiply stress given in spring table by this factor to get maximum stress actually existing in spring

which verified the theoretical results. Agreement was also close to the results of a much more rigorous mathematical analysis of the problem published 25 years ago in Germany, but generally neglected by designers, probably because there has been no experimental verification until Mr. Wahl's work. He now finds that the stresses at the outer diameter of the springs are materially less than those given in the accepted spring tables, while those at the inside of the coil may be as much as 2.5 times as large as at the outer diameter. Hence he concludes that failures in service are ordinarily caused by overloading at this critical region. He also suggests factors taken from the adjoining curve to convert the tables given in handbooks into safe design data.

Among several commentators who admired the elegance of Mr. Wahl's work, G. M. Eaton, Molybdenum Co. of America, Pittsburgh, said that the problem of spring breakage will not be solved until more attention is given to the steel manufacture and the spring fabrication. In his

Light-Weight Diesel Engines for Vehicles

Progress in Diesel engine building is along two distinct lines, according to *Industrial Bulletin* of Arthur D. Little, Inc. For one thing, it may be constructed so as to operate on any one of several different fuels, such as powdered coal, tar, fats, or vegetable oil, although heavy petroleum products will doubtless be its staple fuel for many years.

A second line of development is toward lighter weight. More horsepower per pound of engine is the result of improved design with stronger alloys and higher speed of operation. Diesel-driven trucks are giving excellent results in England; in fact, one of the new dirigibles being constructed for the British Government will be powered by engines of this type using heavy oil fuel. The Sperry Diesel, developed especially for airplanes, weighs about two pounds per horsepower. Diesel engines, burning heavy oil, are now operating on Russian railroads; oil-electric engines are fairly common in America.

The Diesel is preeminently a high-compression engine, but on account of its own distinctive methods of carburetion and combustion, it does not "knock." A difficulty not entirely overcome is the comparative inflexibility of the Diesel engine, which runs best at constant speed. Moreover, there is difficulty in starting, and high maintenance cost. All these problems nevertheless seem in a fair way toward solution.

Good Practice in Jig and Fixture Details

Principles Governing Locating, Clamping, Arrangement of Jig Legs, Bushings, Latches and Other Elements

BY JOSEPH W. ROE*

PRESSURE due to the feed and rotation of the cutter should be against the solid part of the fixture, not against the clamp. This principle is often violated, as the wrong way is usually more convenient. (Fig. 1.)

In general the feed should be against the rotation of the cutter, not with it. This avoids a tendency to dig in. This has been good practice for many years. There is, however, some tendency away from this of late years.

Locate the feed and cuts to throw the burrs for the various cuts on the same side, to reduce burring operations as far as possible. In order to be sure that burrs do not vitiate correct setting in subsequent operations, it is wise

Fig. 1

Fig. 2

to provide clearance grooves on locating surfaces so that burrs cannot, even if left on, interfere with correct setting.

Locating Surfaces Should Be Small

Locating surfaces should be as small as consistent with proper support and wear. The larger the surface, the more care and time are necessary to keep it clean and free from chips which destroy proper setting.

If a surface is to be matched in a milling operation locate from that surface as at B, Fig. 2. It may be more convenient to locate from the opposite face, but locating from the matching surface, is correct and produces better work. A variation in the thickness of even a half of a thousandth

against the work during clamping and be locked in position after the work is set.

It should be easy to keep the locating surfaces clean, therefore, there should be ample clearance for chips. If possible accumulated chips should fall away from, rather than on to the locating surface when the work is removed. If possible keep the locating surfaces completely covered by the work, so that chips cannot collect on them.

All the locating surfaces of a jig or fixture should be fixed. Movable surfaces should be used for clamping only.

Buttons or pins, hardened and ground, are often better for locating than flat surfaces as they are easier to keep clean and afford easier adjustment for wear. They are better when acting endwise than sidewise, as there is no bending action and they are more readily set up for wear. (Fig. 4.)

It is better to support castings on buttons or pins than on flat surfaces. They position better and more definitely. Surfaces which locate drop-forgings should have clearance for the flash, and preferably should be located from one side of the flash only, as the dies which made the forging may not have been exactly matched. Locating from the upper side of the forging, or that above the flash, is preferable.

The clamping should not produce any horizontal sliding action across the locating faces as this causes wear.

Fig. 4

Fig. 5

Locating and supporting points should be as far apart as the nature of the work will allow. (Fig. 5.)

The locating and support points should be visible and easily accessible to the operator.

Work Pieces Not to Be Stacked

Do not stack pieces one against another, if accuracy is required. In multiple work each piece should be located independently against fixed stops. In well-designed fixtures this is done, although several pieces may be clamped by one motion.

In multiple milling fixtures do not mill the pieces serially, with a single cutter, if the runs are long. Use multiple cutters, one for each piece and feed across the row. This reduces the length of feed and therefore the cutting time. This applies, of course, to fixtures with a reciprocating feed, not to those with rotary, continuous feeds.

Parts of the fixture requiring accurate location should be held by screws and dowels or splines. The screws should not have to perform the double function of locating and holding. (Fig. 6.)

When locating blocks are assembled into fixtures it is sometimes desirable to arrange the screws and dowels as shown in Fig. 7. When arranged this way, the contacting surface only is hardened, leaving the section carrying the

Fig. 3

will show, although it may not affect the operation of the piece.

Avoid sharp corners between locating surfaces. They catch dust and dirt and are hard to clean. (Fig. 3.)

The number of fixed supports should not be more than three. These should be as far apart as possible. If other supports are needed they should have only spring tension

*Professor of industrial engineering, New York University. The article is taken from Professor Roe's paper, "Principles of Jig and Fixture Practice," presented Dec. 3, at New York, before the American Society of Mechanical Engineers.

Formulas for determining the probable profit on proposed jigs and fixtures, as well as other tooling equipment, and some general principles of fixture design, were also features of Professor Roe's paper. These were given in THE IRON AGE of Dec. 13, page 1489, and Dec. 20, page 1575, respectively. The paper concludes with a bibliography of books, technical papers and magazine articles relating to jigs and fixtures.

dowel pins soft, so that the reaming of the holes and the alinement of the piece can be done after hardening.

Where the positioning need be only in one direction, the side of the piece or preferably a tongue and groove may

Fig. 6

Fig. 7

Fig. 8

The Tapered Pin works Faster and there is Less Likelihood of Sticking.

Fig. 9

be used for locating, and the screws go through slotted holes. (Fig. 8.)

If position pins are used for locating a previously drilled hole, that portion which is full diameter should be as short as is consistent with wear, and the rest or upper part of the pin tapering. (Fig. 9.)

Locating pins should be hardened and ground with clearance for burrs and chips. When used with counter-bored holes they should center on only one diameter.

When two pins are used for locating one should be flat-

Fig. 10

Fig. 11

Fig. 12

tened, on the sides toward and away from the other pin. (Fig. 10.) Sometimes it is desirable to flatten both pins, the planes of the flattening being at 90 deg. as shown in the lower figure.

If one pin is higher than the other, preferably the larger one, the work can be seated more rapidly.

Principles Relating to Clamping

Under no circumstances should the line of clamping pressure come above the stop. If it did there would be a tendency to lift the work. Side clamps should press down-

ward as well as inward. (See Fig. 1.) By so doing the clamping tends to seat the work.

The clamp should be immediately opposite the supporting point, with solid metal between. Disregard of this leads to springing the work, or lifting of the work due to the support acting as a fulcrum. (Fig. 11.)

Clamps and adjusting points should be operated from the front or working side of the fixture. (Fig. 12.)

The tool thrust should be taken up by an adequate, fixed stop, not by the friction between the work and the clamp. Clamping jaws should, if possible, be at right angles to the direction of the cut, not parallel to it.

All the clamping strain should be cared for within the fixture itself. None of it should be transmitted to the table of the machine.

Cams or wedges, if used for clamping, should be so designed that the pressure and feed tend to tighten them, not to loosen them.

Fig. 13

Fig. 14

Fig. 15

Clamps should have springs and washers under them so that the operator will not have to hold them back while inserting the work. (Fig. 13.) A better form, with the spring concealed, so that chips cannot interfere with it, is shown in Fig. 14.

To save time in loading and unloading a fixture, clamps which have considerable motion should, in order to clear the work, have a rapid action when free from the work and a slow motion with increased power when they are brought into contact with it. A variety of devices are available, such as the toggle-joint, bayonet screw, interrupted thread, slotted clamp, etc.

Clamps holding castings and irregularly shaped surfaces should be on the floating principle to enable them to adapt themselves to the shape of the work.

Legs, Bushings and Other Jig Details

The center of gravity of the jig, with the work in it, and also the thrust of the drill should lie within the geometrical figure formed by the supports. This avoids a tendency for the jig to lift or tip.

A drilling jig should have four legs. With a three-legged support, it will rest stable on any surface. If a chip is under one leg of a three-legged support the fact will not be detected. With a four-legged support the jig will teeter if it is on an uneven surface or a chip is under one of the supports.

Supporting strips or lugs are sometimes better than legs as they are less likely to drop into T-slots or holes in the machine table.

Loose or screwed-in solid bushings should not be used where accuracy is important. Where screwed-in bushings are necessary they should center on cylindrical surfaces, not on the threads.

The length of bearing for the drill should, in fixed bushings, be about one and one-half to two times the diameter of the drill; in slip bushings about two to three times the diameter of the drill. If the bushing is longer than this,

the remainder of the length farthest from the work may be relieved.

Bushings should not be located close to the work with the object of carrying the chips up through the bushing except when the holes to be drilled are in a machined face that is clamped against a similar face in the jig. It is better, when the design will permit, to allow the chips to clear between the work and the bushing. About one drill diameter is usually sufficient. For small holes where great

Fig. 16

Fig. 17

accuracy is required the bushing should be brought down close to the work. For drills smaller than No. 31 this dimension may be approximately 1/64 in. with drills ground with a flat point.

In the joint of a latch give the latch the widest possible hold on the hinge-pin. (Fig. 15.)

A still better type of latch is shown in Fig. 16, which gives better side support when in working position. If possible avoid placing clamps in a latch which carries drill bushings, as any clamping pressure has a tendency to spring the latch and throw the bushings out of alinement.

Preferably a jig latch should have a support or stop to hold it when it is thrown back. This lessens the possibility of misalinement through use.

It may be of advantage to have the hinge pin tapered. This permits readier adjustment for wear, etc.

Thumb-Nuts and Levers Eliminate Wrench Handling

Thumb-nuts, fluted nuts, and levers should be used where the quantities are large, as the necessity of handling wrenches is thus avoided. They should be large enough to give the required pressure easily. When it becomes necessary for an operator to use a mallet, time is lost and either the work or the fixture is likely to be sprung.

Thumb-nuts and hand knobs should have ample clearance around them to permit their being manipulated properly and to avoid possibility of injury. Avoid knurling nuts and handles. When covered with cutting lubricant they are irritating to the operator's hands under constant use.

If it is necessary to use a wrench in setting the work, the various nuts should preferably be of the same size, so that change of wrenches is not necessary.

All exposed screws, nuts, and lugs, the motion of which might catch the operator, are to be avoided, and all sharp corners and edges should be removed.

The operator's hands must be well clear of the cutters during the insertion, clamping, and removal of the work.

There should be no danger of destruction of the work, tool, fixture, or machine through the over-running of the cutter.

It is desirable to have the cutting zone as close to the machine table as possible. If, for some good reason it must be high, then the surface taking the thrust of the cut should be high; i.e., as nearly in line with the cut as possible. (Fig. 17.)

It is desirable that parts subject to wear be renewable without destroying the jig or fixture.

Nature of "Blue Brittleness" in Steel

SHORTLY after the war a committee of the National Research Council presented a long report on "blue brittleness" of steel, embodying all the facts then known. The phenomenon shows itself in Armco iron as follows: if a series of tension tests is made at varying temperatures, the curve representing the way strength varies with the temperature shows a peak and the corresponding curves for elongation and contraction show a valley at 250 deg. C.

This abnormality is not associated with any crystallographic, magnetic, electrical or thermal changes. Consequently, Prof. K. Honda argued that it probably could be found in other metals which harden by cold work. When such a metal is stretched beyond the elastic limit, it is automatically hardened and strengthened, this action continuing as it necks down.

Annealing wipes out this work hardening and softens the metal, but moderate reheating relieves only the most unstable of these internal strains, and increases the hardness further (a fact proved by experiment). There should therefore be some temperature where the effect of heat and cold work are additive and result in an upward hump in the strength-temperature curve and the opposite condition in ductility.

Assuming that the shape of these curves is the criterion of blue brittleness, T. Inokuty studied the tensile properties and hardness of other metals from very low to moderately high temperatures. He finds similar inflections in the curves as follows: (*Science Reports*, Imperial University, Sendai, Japan, July, 1928) Aluminum from 100 below to 200 deg. C.; tin from 100 below to 30 deg. C.; zinc, in the vicinity of

120 deg. C.; copper, from 20 to 500 deg. C.; lead from 130 below to 40 deg. C.; brass from 100 to 500 deg. C. He concludes that "blue brittleness" is therefore not unique to iron and steel, but is characteristic of metals which can be work hardened and then softened by moderate heating.

Coke Oven Gas for Steel Plants

Asserting that coke oven gas excels most kinds of fuel used in iron and steel work as to its usefulness, composition, calorific value and the possibility of extracting its full heat value, G. Bulle of Düsseldorf, Germany, in a recent article in *Archiv für das Eisenhüttenwesen*, discusses some firing devices which have been developed in Germany. In his opinion coke oven gas can be and is used with advantage either alone or mixed with blast furnace or producer gas. For furnaces in steel works, rolling mills and forges, coke oven gas can be substituted without difficulty for coal, but in the case of shaft furnaces its use is somewhat limited.

Discussing firing devices, he states that some special technically perfect ones have been developed for using coke oven gas. There are a large number of coke oven gas burners, some of which merely lead in the gas while some others aim at a preliminary mixing of the gas with air. A series of them work also by a secondary stream of air or gas. He says gas burners fully depend on the possibility of regulating the flow of gas, on the short flame or the power consumption. In his opinion holders are required for storing this gas because the supply is regular while its consumption is more or less irregular.

BOOK REVIEWS

The Need for Efficiency in Consumption

Economics of Consumption. By Warren C. Waite. Published by McGraw-Hill Book Co., New York. Price, \$3.

If economic theory is to be of any use as a guide to industrial and trade policy today—and it is doubtful whether it has been of any such use in the last 50 years—the greatest need in economic literature is for an original, systematic treatise on consumption.

Economists, since the beginnings of political economy as a distinct field of systematic thought, have been preoccupied with questions of production of wealth and its distribution among the factors of production. Governmental policies, taxation, tariff protection, labor questions, international trade, money and banking, and nearly all of the more modern specialties in the field of economic discussion have been, and still are, approached from the point of view of production.

This has been a natural result of the "efficiency economy" in which most of human history so far has been passed. The main question, in most countries, practically up to the beginning of this century, has been how to turn out enough goods to supply basic human needs, and how to assure each class in society a fair share of them. Despite the unprecedented rapidity of industrial development in the Western nations, this is still true for the world as a whole, for there are vast sections of the human race who still live in a deficiency economy and whose main problem is to produce directly or by trade enough to satisfy even their barest wants.

But for the principal industrial nations, and particularly for the United States, the economic problem has changed its aspect. Our concern is not so much with products and processes, as with consumers and markets. Generally speaking, our technological equipment and resources enable us to satisfy any demand quickly and cheaply. In business language, industry and trade now operate in a buyers', not a sellers', market.

Some of our problems of production, particularly in their human aspect, have perhaps been solved rather by brute force than permanently and satisfactorily, but for the present they do not worry us. Give us a customer and we'll turn out the goods. Before the perplexities that capricious sovereign, the consumer, causes us, the relation of government to industry and other problems of production become insignificant. All our elaborate structure of economic theory explaining the best way to produce goods collapses or becomes purely academic, and we are driven back upon empirical or pragmatic principles of conduct, the rule of thumb and trial and error.

Not only are manufacturers, traders and advertisers forced to guess what people can and will buy and why, but for the economist and the statesman the complex relation between consumer purchasing power and business prosperity has become a vital question wrapped in obscurity, despite the efforts of those Gold Dust twins of American economics, Foster and Catchings, to clarify it. In this fog of uncertainty the searchlight of statistics, upon which we have come to rely so greatly for guidance in production policies, fails to penetrate far or is so dissipated and distorted that our faith in it as a measure of general business conditions is being shaken. In fact, in our understanding of the problems of consumption we are exploring an uncharted sea with only a rude compass, largely ruled by ethical or moralistic principles or prejudices.

A real treatise on consumption that would systematize our fragmentary knowledge and build up a coherent and

comprehensive theory of the market would be to the modern economic world what "The Wealth of Nations" was to the 18th century; but it must be written by someone who is not merely an economist, but also a biologist, a psychologist and an experienced observer of human nature and conduct, without any prejudices about it. Books like Professor Waite's will not serve the purpose, though they may stimulate or irritate others to do some original thinking about the subject. His work is a competent, routine textbook. Its contents list most of the topics that one would expect to be discussed under the head of "consumption," and the text says a little of this and a little of that about each one, but without illuminating or enlivening any of them.

The net result of the book is nothing approaching a fertile conception of the essential problems of consumption and their significance in our business system. Professor Waite, at the end, does indeed vaguely treat a few such ideas as "efficient consumption," and throws out a few promising chips of thought by the way, such as that "the nation with the more efficient consumption must eventually drive the less efficient from the markets of the world." But he does nothing with them, and after wandering around among bits of doubtful theory about the incidence of taxation, a few statistics of the cooperative movement and extravagant praises of standardization, he ends where most discussions of consumption end—on a pious note of hope that "the consumer may be educated to better modes of consumption and stimulated to a pride in efficient consumption."

Books like this are disappointing to the business man, whose interest in the puzzles of consumption is not academic but immediate, direct and concrete, and even to the professional economist, who today is hard put to it to maintain his reputation for knowing something more about the mysteries of business than the business man himself knows.

Virgil Jordan.

Covers Engineering in Concise Handbook

Handbook Encyclopedia of Engineering. Pages 1242, 4½ x 7 in., flexible binding. Published by the Industrial Press, 148 Lafayette Street, New York. Price, \$6.

Based on the same alphabetical arrangement as one or two other useful handbooks of the encyclopedic type, the first edition of Machinery's Handbook of Engineering, edited by Franklin D. Jones, associate editor of *Machinery*, has been published. Essential facts are given on about 4150 subjects in mechanics and engineering, including physical and chemical properties of structural materials and their applications, manufacturing equipment and processes, mechanical laws, rules and formulas, principles covering the design and use of apparatus for generation and transmission of power, metallurgy of iron and steel and non-ferrous metals, definitions of many words and expressions used in mechanical work and data important to designers and builders of mechanical and electric apparatus.

Divided into 24 alphabetical thumb-indexed sections, the book is handy for reference and the headings stand out in bold type for easy scanning. Cross-indexing is a valuable feature, of aid in locating many subjects. Illustrations in the shape of line cuts are used where they are beneficial to the full understanding of the text. Tabular matter is employed sparingly for giving data in connection with a number of the topics.

There is some use of mathematical expressions, but for the most part the work is away from the highly technical and leans strongly to the practical side of the matters discussed. The type is splendidly readable and the appearance

of the pages excellent. It should be of great assistance to engineers engaged in a wide variety of work and doubtless will take its place promptly alongside Machinery's Handbook of machine shop and allied practices.

S. G. K.

Industrial Safety from Many Angles

Industrial Safety Organization for Executive and Engineer.

By Lewis A. De Blois. Pages, 328, 6 x 9 in., 20 illustrations. Published by the McGraw-Hill Book Co., New York. Price, \$4.

"Safety first" not being a sufficiently comprehensive slogan, the author is helping expand its comprehensiveness to include "safety all the time" and "safety for all, everywhere." He goes into the questions of accident mortality, fatality (or frequency) rate, injury frequency rate proper, also injury severity rate; classifying accidents and injuries by causes; shows that investigation, analysis and prevention are increasing, and that they pay; gives the requirements for safety and places the responsibility for accidents; lays down the general qualifications for a safety engineer; takes up the purpose and structure of safety committees; points out the advantage of stimulating rivalry in the "game" of accident prevention.

Safety rules, which necessarily differ for various industries, as well as for different grades of intelligence in the workmen, and even for different races are treated minutely, as are the general protective principles of activities for securing safety appliances for buildings or equipment, and personal protection.

If I had written the book, I would have mentioned a method that I have employed, when the union would not prevent: namely, not merely refusing remuneration to the one causing an accident by contributory negligence, but fining him who caused it by carelessness.

The influence of distraction, fear and fatigue, as well as of youth and inexperience, is taken up in sufficient detail; those of lighting and inspection less thoroughly; that of temperature not at all.

The typical specimen Safety Committee reports given are good guides for the preparation of such documents.

Properties and Uses of Metals and Alloys

Metallurgical Handbooks. "Werkstoff-Handbuch Stahl und Eisen," 200 loose leaves, 6 x 8 3/4 in., leather binder, edited by Karl Daeves for the German Iron Institute and published by Stahleisen, Dusseldorf, Germany. "Werkstoff-Handbuch Nichteisenmetalle," 185 loose leaves, 6 x 8 3/4 in., leather binder, edited by G. Masing, W. Wunder and H. Groeck for the German Society of Engineers and published by Beuth, Berlin S-14, Germany. Price, 18 gold marks each.

An exhibit of structural materials in Berlin a year ago had as one of its numerous features the issuance of two note-books on the properties of metals. One is on iron and steel, the other on non-ferrous metals and alloys. Together, they are a compendium of information on the properties of metals and alloys, methods of testing them, and practical applications and uses. The books are in the form of data sheets in loose-leaf note-books, and it is planned to issue additional and revised sheets at six-month intervals.

The two volumes are conceived along somewhat similar lines, outlining first the general properties of the materials, then uses and applications in practice and finally the various properties of particular alloys. The general plan seems logical and makes for ready reference.

The volume on iron and steel consists of five sections, one section on mechanical and physical properties of the metals and the methods or machines for testing them (in-

cluding 18 headings, such as strength, hardness, fatigue, magnetic, electric, wear and corrosion), one section on alloys of particular origin or composition (including 16 headings, such as carbon steels, austenitic steels, silicon steels, chrome-vanadium steels and cast iron), one section on materials for particular applications (including 23 headings, such as magnet steels, rustless steels, tool steels and locomotive steels), one section on heat treatment and microscopic examination and a final brief list of specifications, in form resembling those of the American Society for Testing Materials or of the Navy.

The books are, obviously, a compilation on the present state of the art in applying metals in industry. For the American reader, then, it will be convenient to indicate the scope of the books by comparing them with our most recent reference book on similar topics, namely, the handbook of the American Society for Steel Treating. The latter corresponds in manner of treatment rather closely with the German volume on iron and steel. Even the contents and the data themselves are quite similar.

It is indeed hardly surprising to find that the steels in use in the two countries are almost identical when used for similar purposes, since interchange of publications has made information mutually available. The rustless irons, the stainless steels, the silicon transformer sheets and dynamo sheets, the heat-treated alloy steels and indeed almost all special steels are recommended for essentially the same purposes, in the same compositions and the same conditions of heat treatment in the books from the two countries.

In the treatment of the subjects, however, there are certain differences. These differences in treatment suggest, and are probably the result of a difference in the position of metallurgical science in industry. It is generally held, and with much justification, that scientific thought and invention in metallurgy have in the past been more advanced in Germany than in the United States. Admittedly, the Germans have been masters of painstaking technique; and in the field of invention one must remember their priority, for example in stainless steels (Strauss, 1911) and duralumin (Wilm, 1910).

On the other hand, it would seem that in the metal trades the application of scientific thought has been much more widespread in the United States than in Germany. The variety of heat-treated alloy steels, the knowledge of details of applications in industry and the dissemination of knowledge to the so-called practical man is much more satisfactory in our country. Those who concede a superiority in scientific method and technique to Germany can still find comfort in the fact that the average refinements in manufacture are on a much higher level in the United States.

These relations of science to industry are reflected in the treatment of subjects in the German and the American handbooks. Many of the subjects in the German volume are discussed from the standpoint of the investigator in the research laboratory, and although they are never abstruse, they nevertheless often deal with the nature of the materials instead of stressing the practical results of these investigations. In other words, they are scientific books and (very properly) deal with principles.

Two instances serve as examples. The section on magnetism is a complete discussion of the properties and methods of test, and includes no less than nine wiring diagrams for test apparatus. The section on cast iron is a quite thorough treatise on the nature and properties of that material—not the method for making it, but an intimate study of its properties when made.

The advantages of such thorough scientific treatment are obvious. On the other hand, there is lacking in these volumes a sufficiently satisfactory practical treatment. Two instances from the American handbook will emphasize the point. For certain kinds of detailed practical directions, a "Recommended Practice Committee" has assembled the best

current thought on the state of the art, and has given details enabling any intelligent manufacturer to put the material into actual use at once. This is found in a number of instances in the American handbook. The other example is the article on cutting efficiency and tool performance, which finds no counterpart in the German handbook.

The examples illustrate a slightly different spirit in treatment, and it is felt that the German volume could to advantage improve its contents along the lines indicated, while at the same time preserving its own distinctive good qualities.

The volume on non-ferrous metals covers a wider field and is therefore necessarily less complete in its details. Nevertheless, a large amount of information is compiled. Section A is a general introduction. Section B treats the general mechanical properties including hardness, strength, wear resistance and machinability. Section C discusses microstructure, chemical analysis, corrosion tests, X-ray spectrometry and potentiometric measurements. Sections D to G cover the various properties of copper, brass, bronze and aluminum; section H treats of duralumin and related alloys; section J cast aluminum alloys; section K magnesium and its alloys; section L tin, lead and zinc; and section M nickel, manganese and chrome. In other sections are outlined the properties of the noble metals, silver, gold, the platinum metals, the amalgas, tantalum, bismuth and cerium. The final section gives a summary of alloys having specific properties—heat-resisting alloys, acid-resistant metals and alloys, bearing-metals, metallic coatings and the metal spray process.

The two volumes can be recommended as a highly useful summary of present-day metallurgical art.

Marcus A. Grossmann.

Value of College Education Analyzed

Relation of Education and Income. By Everett W. Lord. Pages, 32, 6 x 9 in. Published by Alpha Kappa Psi Fraternity, Indianapolis. Price, 50c.

In 1926 the author, who is director of education and research of the national professional fraternity in commerce, enlisted the aid of the various chapters of his organization, and secured uniform data concerning education and income from 7400 individuals in all walks of life. A study of the results (utilizing "medium" values rather than averages) indicates that elementary education adds \$64,000 to the life earnings of the grammar school graduate. High school adds a further \$24,000; a bachelor of arts degree adds \$56,000 more, while a professional degree adds a further \$94,000. Thus the fortunate owner of a LL.B. will (on the average) earn \$238,000 more than an uneducated day laborer during his life.

The International Labor Organization

"The Work of the International Labor Organization" is the title of a 198-page book, selling for \$2.50, published by the National Industrial Conference Board, New York.

Formed under the Treaty of Versailles, the International Labor Organization has been in existence nearly 10 years and is characterized as "in many respects the most vigorous and active section of the machinery of the League of Nations."

How this international body is organized and what it has accomplished is set forth in considerable detail. While some degree of world-wide standardization of labor conditions is regarded as inevitable as international relations become more interwoven, the author points out that the degree of uniformity to be aimed at and the features of employment conditions that should be regulated by international agreement are debatable questions.

The International Labor Organization is commended particularly as a clearing house of information. The data

it collects and distributes on the various phases of industrial employment, as well as on the character and effect of regulatory measures in force, may provide the basis for action by individual nations in dealing with their own particular problems.

Foreign Trade Bibliography

A selected bibliography of foreign trade, listing about 120 titles, has been published by the National Foreign Trade Council; copies may be had from the council, Hanover Square, New York, at 25c. each. The pamphlet is published as a guide to the standard books and reference works most widely used by American foreign traders. Theory, practice, merchant marine, trade with Latin America and with the Far East, and other topics are covered. A suggested "five-foot foreign trade book-shelf" of 40 essential books is listed.

The advantages of steel-frame buildings in resisting earthquakes is discussed in a paper entitled "Earthquake-Resistant Structures," by Wendell M. Butts, civil engineer, San Diego, Cal., which was presented in January, 1927, before a meeting of the Los Angeles section of the American Society of Civil Engineers, and has recently been made available in pamphlet form by the American Institute of Steel Construction, Inc., 285 Madison Avenue, New York. Considerable engineering data are offered, as well as a chart showing the comparative resistance of different types of structures to recent earthquakes.

The annual of the association of French iron masters, the Comité des Forges de France, is again a formidable volume of 1360 pages. It contains a list of members of the association, which includes all of the metallurgical companies of France, with information as to the officers and nature of their products. As in earlier volumes, there is also a directory of the companies, by locality and by the nature of the products, and a classified directory of the suppliers of apparatus and equipment for the iron and steel industry. Reports are printed, also as usual, of the various organizations within the industry, working more or less under the patronage of the organization of iron masters. The headquarters of the Comité are 7, Rue de Madrid, Paris (8e).

New Sensitive Drilling Machines

ARRANGEMENT of the spindle, which automatically compensates for its own wear, is a feature of a model K sensitive drilling machine which has been brought out by the Demco Division of the Merit Equipment Co., Cleveland. The machine can be furnished for either belt or motor drive, with from one to six spindles and with hand or power automatic feed. All revolving parts are carefully balanced and are equipped with ball bearings.

spindle can be raised or lowered by hand while the power feed is in operation.

Tight and loose pulleys are provided for the standard belt-driven machine. The power is transmitted through a pair of hardened steel spiral bevel gears, which run in oil in a gear box, to the rear vertical shaft that is inclosed in a steel tube. On single-spindle machines a standard 1200-r.p.m. motor is substituted for the gear box and is direct connected

atically the moment the shift handle is turned, this being accomplished through a cam with spring tension. Belt tension can be adjusted by means of a small handwheel under the bracket. Cones and idler units can be removed by lifting their respective bearing caps at the top of the bracket.

Table clamping and elevating screws are extended to the front of the table. The base of the pedestal forms a lubricant tank and a standard pump, which may be belted to the rear of the drive shaft, can be furnished. Coolant is returned to the tank by a flexible tube.

Adjustable Snap Thread Gages

FOR convenient and rapid gaging of external threads the Taft-Peirce Mfg. Co., Woonsocket, R. I., has placed on the market the thread gage illustrated, which is an application of the conventional snap gage principle.

This gage "gages a thread with a thread," the gaging members being true thread forms ground in the faces of hardened tool steel anvils and correct in all thread elements. Annular rolls or straight grooves are not employed. Elimination of moving parts, rotating, floating and sliding members, which might quickly become worn and inaccurate is emphasized as insuring lasting accuracy.

The gages may be accurately set with a reference plug gage or by means of wires and measuring blocks to any pitch diameter within their

When Motor-Driven, a Motor Replaces the Gear-Box Unit of the Belt-Driven Drilling Machine. Ball bearings in the spindle are automatically compensated for wear by means of a spring, the arrangement being shown in the sectional view at the right. The sliding head, belt shifter and automatic constant-pressure idler are other features

The patented spindle, a sectional view of which is shown, is accurately ground and is provided with two driving splines. The ball bearings are housed in a dust-proof quill, and are automatically compensated for wear by means of a spring. The sliding head which holds the spindle has a long adjustable bearing and is counterbalanced. It is clamped to the column by means of a single handle. The lever for hand feeding is adjustable.

The automatic power feeding mechanism is mounted on a sliding arm. The feed worm and gear are always in mesh and run in oil in a housing, which has a graduated dial plate upon which the depth to be drilled may be set and locked. When drilling is completed the feed disengages automatically, the spindle returns to the starting point, and immediately feeds down again. The feed can also be set for semi-continuous operation, the spindle being advanced by hand from its upper position and the automatic feed becoming operative when the hand feed lever is released. The

to the rear vertical shaft by means of a slip coupling. For multiple-spindle machines a standard 1200-r.p.m. motor may be mounted on a separate bracket at the base of the pedestal and belted to a single pulley on the jackshaft. Snap switches are regular equipment on motor driven machines, but push-button control can be furnished.

The top bracket, cast in one piece and braced front and rear, contains the bearings for the front and rear cones and also houses the belt shifting mechanism and the automatic belt-tension idler, each of which is a separate unit. The drive from the rear cone to the spindle cone is by means of endless flat belt. The belt shifter has two forks and is operated through a small crank handle at the front of the machine. One revolution of the handle produces a change of speed, the various speeds being indicated on the guard plate at the front of the top bracket. The idler is under constant pressure against the belt, the pressure being relieved auto-

Gaging Members Are True Thread Forms Ground in the Faces of Hardened Tool Steel Anvils

range. The threaded anvils can be furnished for any pitch and any percentage of thread engagement desired. Eight sizes are carried in stock, the smallest having a range of $\frac{1}{4}$ - $\frac{5}{8}$ in. and the largest, 3 $\frac{9}{16}$ -4 in. Standard "go" and "not go" anvils are $\frac{3}{4}$ and $\frac{5}{8}$ in. long, respectively. Special lengths can be furnished.

Sales of mechanical stokers in November totaled 116 units with 30,938 hp., as against 100 with 27,219 hp. in October, according to the Department of Commerce. For the 11 months ended with November, the total was 1388 stokers with 459,475 hp. as against 1291 stokers with 451,400 hp. for the corresponding period of 1927.

Automatic Flying Shear for Strip Steel

Straightener and Cutting Machine Takes Metal to 48 In. Width

DESIGNED to straighten and cut to length both hot and cold-rolled strip at a continuous uniform speed, a machine containing both straightening and cutting elements has been brought out by the Hallden Machine Co., Thomaston, Conn. The metal does not stop while it is being cut to length, because the shear unit moves forward, during the cut-off period, with the same speed as the metal feed. This continuous feed of the metal prevents the flattener rolls from

ated readily with unskilled labor. If it is desired to operate as a flattener only, the shear clutch can be disengaged. The machine is stopped and started readily by a Farrel-Birmingham clutch between the motor and flattening stand.

The flattening stand has nine-roll

Combination Flying Shear and Straightener Rolls. Shear is at left, below, and at right is other illustration

marking the metal during the cut-off period. Patents are pending.

No tripping mechanism in front of the machine is used, the length of cut being regulated by a special mechanism which indicates directly from the feed rolls. This makes it possible for the cut pieces to fall directly into a rack, which can be removed by a crane when full, or on to a conveyor or inspection table. A change in length of cut is accomplished merely by setting a pointer on a scale. The machine does the rest automatically.

This machine is now built in three sizes: No. 4 for 24-in. width of metal, No. 5 for 36-in. and No. 6 for 48-in. This model is suitable for anything from thinnest gages up to $\frac{1}{4}$ in. thick. The machine can be ganged up with a rolling mill, trimmers, slitters, etc., where a uniform, continuous feed is required. In this way an entire operation can often be saved, with its handling expense.

In design this is primarily a steel mill type machine—very heavy and rugged, with a low center of gravity. The height of the metal feed-line from the floor is very low, making it easy to gang up this machine with existing machines. The machine can be oper-

ated readily with unskilled labor. If it is desired to operate as a flattener only, the shear clutch can be disengaged. The machine is stopped and started readily by a Farrel-Birmingham clutch between the motor and flattening stand.

Foundrymen Announce Winners of Prizes

The board of awards of the American Foundrymen's Association announces that the committee appointed to select the three prize-winning convention papers for 1928 have chosen the following:

"Temperature Measurements of Molten Cast Iron," by H. T. Wensel and W. F. Roeser.

"The Effects of Lead on the Properties of a Complex Brass," by O. W. Ellis.

"Reducing New Sand Consumption in a Steel Foundry," by H. A. Mason.

H. T. Wensel is associate physicist and chief of the pyrometry section of the Bureau of Standards, Washing-

ton. W. F. Roeser is assistant physicist in the pyrometry section of the Bureau of Standards with Mr. Wensel. O. W. Ellis is metallurgical engineer in the research department of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. H. A. Mason is assistant to the superintendent of the Gould Coupler Co., Depew, N. Y. The prizes are \$100 in cash.

The board of awards announces that the prizes will be presented at the 1929 convention. It also states

that similar prizes for papers presented at the 1929 Chicago convention will be awarded for papers on any of the following subjects: gray iron, steel, malleable cast iron, non-ferrous metals, sand control, general foundry practice. Only one paper in any class will be awarded a prize.

Spiegeleisen Imports Small This Year

Imports of spiegeleisen, according to official data obtained from the Bureau of Foreign and Domestic Commerce of the Department of Commerce, have been at a much lower rate this year than in 1927 despite an increase in consumption.

Last year, 7460 tons, or 621 tons per month, was received, the largest imports being 2195 tons in May. For the first 10 months of this year, or to Nov. 1, 1928, only 2820 tons, or 282 tons per month, had been received. The largest imports this year were 1130 tons in September. The total value of the 7460 tons imported in 1927 is given as \$223,463, while the 2820 tons imported for the first 10 months of 1928 is reported as having a valuation of \$79,588.

A drop of 10,012, or 8.7 per cent, in the total immigration for the current fiscal year is reported, as compared with the corresponding months of last year. All of the principal sources of present-day immigration show a decrease, but Europe is now contributing a larger proportion of the total. From July 1 to Oct. 31, 1928, the total number of immigrants was 104,545. Europe supplied 52,480, Canada, 25,901, and Mexico, 19,369.

Universal Jig for Drill Table and Vise

A SPECIAL slotted stop and bushing plates are offered by the Modern Machine Tool Co., Jackson, Mich., to be used as a universal jig in conjunction with the combination drill table and vise. The stop is

or they may be set on parallels to any height required by the work. By raising the bushings slightly out of bushing plates, the center distance between bushings may be easily determined with a micrometer. Bush-

Slotted Stop and Bushing Plates Used as a Universal Jig, with Combination Drill Table and Vise. This arrangement has great flexibility and the set-up may be repeated as required, a sample piece being used as a gage

bolted to the top of the combination and extends over the opening of the vise. The work is then placed in the combination, against the stop. Bushing plates, with bushings of proper size, are then located over the work as required, one to four bushings being used.

The plates may be bolted to the table, using the slots in the table,

ing plates are designed to fit standard bushings.

This enables users of the combination drill table and vise to use this jig for any class of work. In many shops, where repeat processes are necessary at frequent intervals, a sample piece clamped in the vise may be used to adjust the stop and bushing plates for drilling duplicates.

Special Equipment for Spot Welding Boxes

A MACHINE for welding boxes that require several different electrode combinations in order to reach all corners is shown in the accompanying illustration. The design includes a multiple electrode holder that swivels from one position to an-

other so that all parts of the assembly can be reached without extra handling.

The machine is built by the Thomson Electric Welding Co., Lynn, Mass., and is designated as the model 176-C special. It is rated 15 kw. and

The Multiple Electrode Holder Swivels So That All Parts of the Boxes Are Welded Without Extra Handling

is either foot operated or power driven. The power drive is either by belt from the lineshaft or by motor and is through a six-speed gear box. The lower terminal post swivels to three positions and the horns and dies in the post are adjustable both horizontally and vertically. The upper die also swivels horizontally and may be adjusted vertically.

All-Metal Flexible Coupling

AN all-metal flexible coupling designed to take care of ordinary conditions encountered in a direct drive has been placed on the market by the T. L. Smith Co., Milwaukee. In this coupling, designated as the style B Flex-Ring, flexibility is furnished by means of two long ring-shaped springs, which, it is stated, permit end play of motor shaft without any sliding action and effectively smooth out the shocks and vibrations in the drive. The coupling is also said to compensate for a large amount of

Flexibility Is Furnished by Two Long Ring-Shaped Springs

both angular and offset misalignment without causing excessive bearing loads.

Arrangement of the coupling may be seen in the illustration. The cast steel hub has two projections machined to fit the gaps in the driving springs and is provided with a recess for the felt packing used to retain grease in the housing. The housing, of semi-steel and machined all over, carries two keys corresponding to the lugs in the hub. These keys are set into machined recesses in the housing and are riveted into place. The flange is also of semi-steel and is machined all over. The heat-treated springs are machined to fit over the projections on the hub and the keys in the housing. Flange and housing are bolted together and all inside parts are held in position without snap rings or bolts.

The 77 establishments engaged primarily in making saws reported products valued at \$22,627,990 in 1927, a decrease of 8.4 per cent under a production value of \$24,709,211 reported by 71 establishments in 1925, according to the Bureau of Census.

1000-Ton Upper-Toggle Coining Press

AN upper-toggle press capable of exerting 1000 tons pressure has been added to the line of the Ferracute Machine Co., Bridgeton, N. J.

Tensile stresses are taken by four 8-in. diameter vertical steel rods shrunk in the columns. The toggles are of cast steel and have hardened and ground steel bushings. The steel

and the moving mechanism is taken by two compression springs on the top of the press.

The main gear is a steel casting and the pinion a steel forging; both have cut teeth. Main and backshaft bearings are bronze bushed. The press is equipped with a jaw clutch and the ram with a knockout. Lubrication is by means of a force system. The press illustrated has 2½-in. stroke but the same machine with longer

At the Left Is Shown the Fan Which Forces Air Around and Across Parts Which Conduct the Heat from the Interior, an Inclosing Jacket Controlling the Path of the Cooling Air

Sturdy Construction Is a Feature of the 1000-Ton Toggle Press, Which Is Arranged for Direct Motor Drive

toggle-links are bronze bushed and the steel toggle pins are hardened and ground. The pitman is of cast steel and is bronze bushed. Vertical adjustment of the ram is obtained by a horizontal wedge which is operated by a screw and capstan hand wheel. The weight of the adjustable head

stroke can be furnished. The distance between columns, right to left, is 32 in., and the depth of bed, front to back, is 36 in. The height, bed to ram, at top of stroke and adjustment, is 20½ in., but this may be changed. The press has direct motor drive and makes 30 strokes a minute.

Germany Puts Non-Ferrous Semi-Finished on Free List

HAMBURG, GERMANY, Dec. 11.—Effective Feb. 1, the present duty on all non-ferrous metal scrap and on non-ferrous semi-finished material will be cancelled and these materials placed on the free list. Germany is a large buyer of brass, bronze and copper semi-finished products in the United States, and it is expected that elimination of the duty will serve to increase this business.

Foundry Equipment Orders Show Gain

The index of gross orders taken by 20 members of the Foundry Equipment Manufacturers Association was 197.8 in November, compared with 185 in October and 170 in September.

Net orders (after deducting cancellations) stood at 195.2. The November index of shipments was 264, against 254.3 in October and 129.7 in September. The index of unfilled orders on Nov. 30 was 403.9, compared with 462.6 one month previous and 529.5 on Sept. 30. The base for the indexes is the average of monthly shipments for 1922, 1923 and 1924, taken as 100.

Welded Chain Simplification

WASHINGTON, Dec. 24.—The Division of Simplified Practice, Department of Commerce, has sent copies of the proposed simplified practice recommendation for welded chain to manufacturers, distributors and users for acceptance. When the recommendation has been accepted by the industry as a whole it will become effective for new production on Feb. 1, 1929.

Inclosed Fan-Cooled Electric Motor

ANEW line of totally inclosed, fan-cooled motors, of 1 to 50 hp., has been developed by Allis-Chalmers Mfg. Co., Milwaukee. All of the active parts, such as stator core, stator winding and the rotor, are completely inclosed, preventing contact of outside air, dirt, dust, fumes, moisture, etc., with the interior or active parts.

Heat is carried away by a sufficient volume of cooling air forced around and across those parts which conduct the heat from the interior to the outer surfaces. A circumferential air jacket controls the path of cooling air.

Conference of Statisticians Sees Active First Quarter

"The year 1928 as a whole has been a year of industrial and commercial activity slightly higher than in the preceding year, but little if any above the normal annual rate of expansion of general business except for a few months in the last half of the year.

"The automobile and building industries have continued to be the leading factors in the business movement; the extraordinary expansion of stock exchange activity during the year, as in preceding years since 1923, stands in strong contrast to the general growth of industry and trade.

"Current momentum will probably sustain general business activity at a fairly high level through the first quarter of 1929."

That, in substance, is a collective interpretation of business statistics, gathered by statisticians and economists of organizations and corporations representing about 30 of the leading industries of the country and formulated at the first monthly meeting of "the Conference of Statisticians in Industry," a new organization operating under the auspices of and with the cooperation of the National Industrial Conference Board, New York.

The value of files produced in 1927 by the 36 reporting establishments was \$12,973,734, a decrease of 4.2 per cent under \$13,540,953 reported by 38 establishments for 1925.

Price Declines in European Markets

Germany and Belgium Face Falling Values—Better Shipbuilding Orders in Britain Expected to Stimulate Trade

(By Cablegram)

LONDON, ENGLAND, Dec. 24.

IRON and steel markets are quiet on the eve of the holidays, but the outlook is regarded as slightly more favorable, in view of the increase in shipbuilding orders placed in recent weeks. Northeast Coast producers are preparing to relight additional furnaces, as current Cleveland output is being absorbed by local consumers.

Thomas W. Ward, Ltd., Sheffield, has purchased the Low Moor Iron Works from the receiver, and will continue the business after reorganization and rearrangement of the plant.

John I. Thornycroft & Co., Southampton, have been awarded contract from the Canadian Government for two destroyers, costing about £670,000 (\$3,250,000) for the two, and calling for delivery in the spring of 1931.

Heavy steel makers are looking for

better times, but export business still is difficult. Foreign ore markets are idle.

Tin plate markets are quiet but the makers will begin the new year with well-filled order books, on the restricted output arrangement, for several months. Some are heavily committed up to June. Indications point to increase in world demand and the prospects for the tin plate trade are quite bright.

Galvanized sheets are quieter, but most mills are well placed over January and prices are firm. Black sheets are dull.

On the Continent of Europe

Continental markets are quiet and prices are weakening, on absence of buying. The works are reported as in need of orders.

to the lockout, and that suspension of German production merely retarded a definite downward movement.

When the present shortage of material in the domestic market is satisfied, there are indications that home trade in iron and steel will begin to slacken. The volume of bank credits to business have declined sharply. The import surplus of Germany has decreased recently, but this is largely the result of pressure for export orders to offset the decline in domestic business.

Export of machinery is considered satisfactory and in the first nine months of this year shipments of machinery to foreign markets reached a total value of 773,675,000 m. (\$184,135,000), compared with 612,300,000 m. (\$145,727,000) in the first nine months of 1927. The price per unit of weight of machinery exported this year has been 78 per cent greater than in 1913.

No agreement has been reached between the European Rail Makers' Association and Great Britain on exports of rails. The disagreement is on the proper handling by the association of excess British deliveries to British colonies. The excess since formation of the association has been 120,000 tons. The association favors suspension of rail deliveries until this excess has been eliminated, while Britain urges settlement by monetary compensation. No agreement as to

Germany Foresees Price Decline

Lockout Believed to Have Retarded But Not Stopped Lower Export Prices—More Scrap Used in Steel

BERLIN, GERMANY, Dec. 12.—The outlook in export trade is rather uncertain. Despite the lockout, German mills report few cancellations of export orders and are resuming operations as rapidly as possible. An early decline in export prices is expected

as a result of resumption of steel production here. As the export prices of bars registered a slight decline in November, during the period of the lockout, it is concluded by German observers that a price decline in international markets was due, prior

British and Continental European prices per gross ton, except where otherwise stated, f.o.b. makers' works with American equivalent figured at \$4.85 per £ as follows:

the amount of compensation has been reached.

Shipbuilding conditions are unsatisfactory. A strike involving about 45,000 shipyard workers has been in progress for more than two months and has caused some distress among shipbuilders. The Schiffswerke und Maschinenfabrik A. G., Hamburg, has suspended payments to its creditors, and the Vulcan company, the largest shipyard at Stettin, has been dismantled. The Tecklenborg shipyard in Bremerhafen and the Friedrichs yard in Einswarden have been closed. The Schickau yard at Elbing, which formerly built battleships on a

large scale, has suffered serious financial losses. Shipbuilding orders have declined to about 500,000 tons, while the capacity of German yards is about 900,000 tons.

A recent governmental survey of raw materials used by the iron and steel industry has reported that of 21,980,000 tons of ore and scrap used in 1913 in the territory of pre-war Germany, 15,330,000 tons was consumed in the present area of Germany. In 1926 consumption totaled 19,680,000 tons. In 1913, 73 per cent of the material was ore and 27 per cent scrap. In 1926, 59 per cent was ore and 41 per cent scrap.

Spot Export Prices Higher

German Mills Secure Premiums for Early Shipment But Grant Concessions for Next Year—Some Rod Inquiry

BREMEN, GERMANY, Dec. 11.—The rather unexpected end of the lockout at German steel mills has brought a flood of orders from European export buyers, but the Stahlwerksverband has informed the exporters that at present no export tonnages can be accepted as the extensive demand from the German heavy hardware industry must be satisfied first. Until about Dec. 19, no steel can be accepted for export, except medium gages and sizes of plates and tubes, available from mills in Upper Silesia and Saxony.

The current export market on steel is somewhat unusual, as concessions are obtainable on January-February shipments, while premiums are being offered for immediate delivery. The nominal price of steel bars is £6 4s. (\$30.13) per metric ton, f.o.b. Antwerp, but for shipment within three weeks as much as £6 8s. 6d. (\$31.23) per ton, Antwerp, has been paid. The usual quotation for 3/16-in. and 1/4-in. rounds is £7 7s. 6d. (\$35.84) per ton, Antwerp, but for early shipment offers of premiums have brought this price to as much as £7 15s. (\$37.67) per ton. About 580 tons of angles and tees, nominally worth £5 17s. 6d. (\$28.55) per ton, brought a price of £6 7s. 9d. (\$31.04) per ton, f.o.b. Antwerp, shipment being guaranteed on a steamer from Antwerp Dec. 19. These premiums are being secured by mills in the Saar, Czechoslovakia and Luxemburg.

Recently Japan has been actively inquiring for wire rods and about 15,000 tons of such business is pending at present. Otherwise Japanese merchants and importers have been unusually quiet in the past month. Most exporters have refrained from quoting on the wire rod inquiries as the available supply is apparently limited. Although the quotation is nominally £6 2s. 6d. (\$29.77) per ton, quotations to Japan for February shipment have been £6 7s. 6d. (\$30.98) per ton and as much as £6 10s. (\$31.59) per ton was asked

for January shipment. As Japanese buyers are apparently not inclined to pay such prices, it is believed in some quarters that some of this business may go to American or Canadian mills.

Business with Japan in light gage sheets has continued moderately active throughout the lockout as the sheet mills rolling these light gages were not affected. Recently quotations on these sheets have been advanced to a range of \$75.50 to \$76 per ton, c.i.f. Japanese port, and concessions from this level are reported unusual.

International Steel Cartel Quota Unchanged

WASHINGTON, Dec. 24.—By a decision of the central directing committee of the International Steel Cartel, meeting in Paris on Dec. 13, the cartel will continue to operate over the first quarter of 1929 with the same production quota as in each quarter of the present year, 7,321,750 metric tons or 29,287,000 tons per year, according to a cablegram received by the Department of Commerce from the commercial attaché in Paris.

Luxemburg Looks for Export Trade

LUXEMBURG, Dec. 10.—The iron and steel markets continue quite firm, termination of the German lockout having had no appreciable effect on business. Despite Germany's return as a competitor for steel business, the loss of production through the lockout will probably be a factor for some time.

Export trade is only of moderate proportions at present, but more settled conditions in China are expected to bring a revival of merchant buying in that country. Exporters here doubt that the Japanese Government will make any further increase in the

tariff on iron and steel, although the Japanese steel producers are still urging higher duties. A similar demand for increase of the steel tariff is under consideration in Canada.

On Nov. 1 there were 38 Luxemburg blast furnaces operating of a total of 47 in existence. October production totaled 236,429 metric tons of pig iron and 228,973 tons of steel ingots.

Imported Steel Prices Lower—Export Trade Quiet

NEW YORK, Dec. 24.—Continental steel prices have registered a further decline, so that quotations on shapes to importers in New York range from 1.75c. to 1.80c. per lb., duty paid. Consumers are only moderately interested at present, even though current prices represent a saving of several dollars a ton to the buyer. Prices of steel bars from European mills continue high and importers are unable to quote less than about 2c. per lb., duty paid, Atlantic port. Several hundred tons of steel piling for Port Arthur, Tex., is reported to have been awarded by the Texas Co. to the German manufacturer of piling.

Export business continues small, except for some buying by Chinese merchants handling plate cuttings and bar crops. Inquiry from Japan is confined to small lots of special material and some tin plate. The quarterly tin plate requirements of the Nippon Oil Co. are understood to have been awarded, a total of 35,000 base boxes of oil can sizes being placed.

Japan's Steel Production Put at 2,000,000 Tons

WASHINGTON, Dec. 25.—Japanese production of steel in 1928 is estimated at about 2,000,000 tons, according to a cablegram received from Commercial Attaché Halleck A. Butts, Tokyo, by the Iron and Steel Division, Department of Commerce.

Luxemburg Production Large

WASHINGTON, Dec. 24.—The record activity of the Luxemburg iron and steel industry in 1927 will be exceeded, or at least maintained, during 1928, according to reports received from Vice Consul James E. Parks, Luxemburg, on output for the first 10 months of the present year. The production of pig iron totaled 2,279,000 metric tons in contrast to 2,723,356 tons for the 12 months of 1927. Raw steel production was 2,135,876 tons compared with 2,458,439 tons in 1927.

Manhattan Rubber Mfg. Co., Passaic, N. J., maker of mechanical rubber goods, has paid a bonus to all employees, amounting to 2 per cent of yearly salary.

Defective Steel May Take Billet Freight Rate

WASHINGTON, Dec. 24.—Billet rates will be applied on a large number of defective steel products such as damaged sheets and plates throughout various points in Official Classification territory if the Interstate Commerce Commission approves a proposed report by Examiner E. H. Kerwin, made public last Wednesday. At present a number of products now take the fifth class rate or special iron and steel rates. The case was a consolidation of numerous complaints that had been filed against existing railroad tariffs. The protests included both consumers and producers, and the proceeding was known as that of the Wrought Washer Mfg. Co. vs. the Pere Marquette Railway Co., et al. The report represents a complete or partial victory for the complainants, who had asked for either billet, scrap or "reasonable" rates. The examiner further held that proposed changes in descriptions of and rates on waste sheets and plates were not justified and that if new tariffs are filed they must conform to the description he gave of these products.

More Workers and Larger Payrolls in Illinois

Employment in Illinois gained $\frac{1}{2}$ per cent during November, according to Sidney W. Wilcox, chief of the bureau of labor statistics, Illinois Department of Labor. This gain, with others made earlier in the year, placed the rate of employment in Illinois factories at 4.6 per cent above that of November, 1927. The total payroll for November was 1.4 per cent greater than in October, the increase in wages being nearly three times the gain in employment. The impetus in employment has come largely from farm implement manufacturers, makers of machinery, and producers of electrical appliances. Iron foundries have supported the upward movement with a pick-up of 1.5 per cent.

Steel Castings Orders Ahead of Last Year

WASHINGTON, Dec. 24.—Orders for commercial steel castings in November totaled 84,304 net tons, or 59 per cent of the monthly capacity of the 129 concerns reporting to the Department of Commerce. This compares with bookings of 78,082 tons in October, representing 54 per cent of capacity. Production in November was 81,913 tons, or 57 per cent of capacity, against 87,058 tons, or 60 per cent of capacity, in October. In November, 1927, production was 59,008 tons and orders 62,694 tons.

Of the November orders, 34,526 tons was for railroad specialties, being 51 per cent of this class of capacity, while 49,778 tons was mis-

cellaneous castings, being 65 per cent of such capacity.

For the 11 months ended November, 1928, total orders were 899,174 tons, against 841,756 tons for the corresponding period of 1927, the gain coming mainly from the miscellaneous class. Castings for railroad use aggregated 345,809 tons against 344,991 tons for the corresponding 11 months of 1927, while miscellaneous bookings were 553,365 tons and 496,765 tons respectively.

Production for the 11 months of 1928 totaled 934,911 tons, compared with 906,394 tons for the 1927 period. Of the 1928 output, 344,862 tons was for railroad specialties, against 351,296 tons for the corresponding period of 1927, and the output of miscellaneous castings was 590,049 tons and 555,098 tons respectively.

45 Government Ships Sold for Scrap

WASHINGTON, Dec. 24.—It is estimated that approximately 76,500 tons of steel scrap is contained in 45 vessels averaging 5000 deadweight tons each which the Shipping Board has sold to the Union Shipbuilding Co., Baltimore, with the understanding that the ships will be completely scrapped and dismantled within 18 months. The steel is divided about as follows: Plates, 57,375 tons; shapes, 15,300 tons and bars, 3825 tons. The sale price of the ships was \$423,600. The vessels are laid up as follows: James River, 23; New York, five; Philadelphia, two; Mobile, Ala., two; New Orleans, five; Orange, Tex., eight. The Shipping Board now has less than 450 vessels in its laid-up fleets.

Foundrymen's Apprentice Contests for 1929

The apprentice contests that have been held in connection with recent conventions of the American Foundrymen's Association, will be continued as an annual feature, and regulations are ready for distribution to those plants planning to have their apprentices take part.

The contests for 1929 will be held in three divisions—gray iron molding, steel molding and pattern making. Three prizes will be given in each division. The first prizes will consist of wrist watches valued at \$50; the second prizes will be cash awards of \$25, and the third prizes will be cash awards of \$10. Each apprentice receiving a prize will also be given an engraved certificate.

Local contests to determine the best castings and patterns to be submitted in the national contest can be held either by individual plants, local foundrymen's associations, or similar organizations conducting their contests to conform to the rules and regulations laid down by the A.F.A. apprentice contest committee. Local contests must be held in time to have

their entries in the national contest reach the Chicago convention by April 2. Copies of the regulations may be had upon application to the secretary of the A.F.A.

These contests, beginning with the Milwaukee convention in 1924 with only Milwaukee firms participating, have grown in extent until, at the 1928 Convention, 20 plants from six foundry centers had apprentice work entered in the national contest and many more had taken part in the local contests.

Mexican Steel Industry Making Progress

Considerable progress is being made by the steel industry in Mexico. There are two fairly large companies: the Monterey Iron & Steel Works, Monterey, and the Consolidated Rolling Mill & Foundry Co., S. A., Mexico City.

The Monterey company has recently changed its open-hearth furnaces to burn gas from producers instead of fuel oil. The company makes its own silica brick and produces ferromanganese, and also makes all the alloy rods and balls consumed by Mexican mines for grinding ores. The consumption of rods and balls for these purposes is said to be large.

The Consolidated Rolling Mill & Foundry Co. has just completed the installation of a rod mill, which is claimed to be the only one south of the Rio Grande. The company purchased the entire outfit for the mill from the Black Wire & Steel Co., Kansas City, Mo. The capacity is 6 tons of No. 5 rods an hour.

The mill is considered in Mexico as being a decided departure from the original merchant mill usually found in Latin-American countries. The company is also making manganese steel with considerable success, according to a statement by Harry Wright, president of the company, who also says that better results are being obtained from tool steels made by his company for its bolt and nut department than were ever secured from similar steels purchased from foreign countries. The company has installed a department for making automobile bumpers from silicon alloy spring steel.

Large Output of Copper in Canada

WASHINGTON, Dec. 22. — Copper ranks second among metals in Canada in value of production. Output in 1927 was 140,141,823 lb., or a little over 4 per cent of the world's total, according to a report from Consul H. T. Goodier, Vancouver, B. C., made public by the Department of Commerce. Production in 1923 was 86,881,537 lb. The output of British Columbia copper mines in 1927 was 91,685,843 lb., or 64 per cent of the Canadian total.

Low Profits a Challenge to Steel Industry

G. H. Charls, President Flat Rolled Steel Manufacturers, Says

Ignorance or Wilful Disregard of Costs and Straining for Tonnage Cause Inadequate Returns

"HOW long will the iron and steel industry permit its earning power to remain little better than the return on a safe Government bond?" asked G. H. Charls, president National Association of Flat Rolled Steel Manufacturers, in a recent address to the Malleable Iron Research Institute at Cleveland. "When will the steel industry," he went on, "recognize and regulate the causes behind the effect? Is not this a challenge to the ingenuity, sales instinct and will-to-do of all steel producers?"

"It is one thing," he said, "to know the causes that keep an industry from being prosperous; it is quite another thing to influence the membership of an industry to evolve a plan and make it work to rectify the situation."

"There is no short cut to stabilization of an industry. Facts and the causes of unsatisfactory conditions must be squarely faced, recognized and understood. Then unfalteringly the units of that industry must seriously unite and unremittingly cooperate to obtain a true knowledge of what is ethical and unethical, economical and uneconomical, and persistently strive for the attainment of the one and the elimination of the other. This is possible only through group action. The isolationist is a pre-war product."

Ignorance of Costs a Cause of Inadequate Profits

"The most pernicious cause of inadequate returns on invested capital in an industry, and the one which has been and should be emphasized, criticized and condemned most sharply, is an ignorance of the cost of doing business, or the wilful disregard of such cost as is known when a commodity is priced."

"Clearly allied with this prime cause is the absence of market research and analysis to measure demand, together with a blind, unthoughtful attitude which blocks the way to group effort to expand such demand."

"Abram F. Myers, chairman Federal Trade Commission, has said:

The proper pricing of products is naturally the first concern of the business man and one on which he needs all the information and help he can get.

It is a serious mistake for the individual or an industry to permit competition to price its products without any regard for the cost of producing such products.

"In these quandaries, the strong must guide and help the weak, or be crippled and perhaps destroyed by

their unintelligence and misbehavior. The strong must assume leadership, for only the strong can influence and dominate by precept and example and lead an industrial group out of the slough of jungle competition into the knowledge of the fundamental requirements of modern business principles.

"It must ever be kept in mind that a trade association is only a means to an end; that without the active participation of its members, their enthusiastic support, thought and effort, the association will become a joke.

"On the other hand, when the members become conscious of the necessity and the possibilities of group action and apply their intelligence vigorously to the problems of the industry, a trade association becomes the finest—in fact, the only—possible means of self regulation in industry—the fourth leg of the chair upon which an industry rests."

Government Attempting Help and Cooperation

"The Government is attempting to cooperate and to be helpful as never before. There is a momentous reversal of attitude on the part of the Federal Trade Commission toward association work. During the past year many successful trade practice conferences have been held."

"From our perusal and analysis of the decisions handed down in the Trade Practice Conferences with the millwork industry, hickory hand wood-turning industry, cottonseed oil industry and the flat glass industry, it seems obvious that a very constructive piece of work is being done. If these decisions are successfully sustained by law, they will constitute a new Magna Charta to industry throughout America."

"Insofar as we are able to determine from the regular and irregular sources of statistics, the answer to the question, 'How is business?' is: 'Good for the present and the first quarter.'"

"If this question was 'How are profits?' the answer would probably be that the iron and steel industry has been so irritated by auburn figures—5 per cent return may be termed 'auburn'—that it is beginning to shy like a colt when it sees a red-headed girl."

"May I call attention to a chart issued by the National Industrial Conference Board, for it tells a wonderful story of sales achievement."

"Note the automotive industry, operating at the rate of 68.8 per cent

of capacity in 1926; 70.3 per cent of capacity in 1927; earning at the rate of 22 to 30 per cent. Then note the steel industry, operating at the rate of 75.1 per cent in 1926; 68.8 per cent in 1927; earning 4½ to 5½ per cent on its invested capital."

"The question arises, 'What ought to be the profits in an average industry in normal periods of prosperity?' It is estimated that the average profit of all industries in the United States is 10 per cent."

Says Urge for Tonnage Destroys Steel Industry's Profits

"Is it any more than simple intelligence to aspire to such an ideal, such a vision of what so decidedly ought to be? Of course it is not, and yet otherwise intelligent executives seem astonishingly unaware of the ridiculous and really tragic attitude they manifest in the conduct of their business. In their madness and frenzy, they proceed to pull down the supporting pillar of the temple of prosperity, mumbling 'tonnage, tonnage, tonnage.'"

"Apparently possessed, they pursue the shadow of capacity operation and crucify the substance of a sane, average profit on the cross of unintelligent, unreasonable, destructive competition. All ethical and economical thoughts and ideas are thrown to the four winds. They seem to think that business is simply a warfare to eliminate competitors and to establish the survival of the fittest. They are living in the atmosphere of the jungle."

Assails "Ruthless Price Cutters"

"To conduct a profitable business in an industry, it is necessary for the industry to be manned by executives actuated by something loftier than the code of animals—not by ruthless price cutters who ridicule and deny a place to finer ethics and to collective economical judgment."

"The iron and steel industry must come to a fuller realization that only that industry will successfully prevail which resolves to correlate its effort in recognition of the principle that, 'The prosperity of the whole is the individual's greatest opportunity for progress.'"

The Tennessee Coal, Iron & Railroad Co., Birmingham, will install a Rust triple fired recuperative continuous furnace at its Fairfield Works. The furnace will have a capacity of 30 tons per hour of blooms or beam blanks.

Youngstown Assured Access to Waterways

Most Economical Use of All Forms of Transportation Called a Public Necessity—Shipper Ownership of Railroads Opposed

WASHINGTON, Dec. 24. — Long-sought access to river transportation seems assured to the Youngstown district. It is held to be of vital importance to the iron and steel industry of that section as a means of reducing freight costs on inbound raw material, such as coal and limestone, and on outbound manufactured products to the Southern and Southwestern markets. It is maintained that the district will thus be placed in a better competitive relationship with Pittsburgh and other surrounding districts that now enjoy water transportation. Iron and steel makers in the Youngstown district have contended that they have been forced to third place in steel output, being succeeded in second place by the Chicago district, and have assigned as the reason the high freight rates on inbound raw materials, especially coal from the Pittsburgh and Connellsville districts, and also on outgoing manufactured products.

The precise manner in which river transportation for the Youngstown district will be provided cannot be determined until the Interstate Commerce Commission passes finally upon the application of the Pittsburgh, Lisbon & Western Railroad for authority to construct two branches from its present line, one extending northward to Youngstown and the other southward to Smith's Ferry, Pa., on the Ohio River, the two branches, together with a short section of the existing line, forming a north and south line from the Ohio River to the Youngstown district. In its decision last week the commission specifically said that "public convenience and necessity . . . require the provision of rail transportation between the Ohio River and the Youngstown district in connection with the transportation on the Ohio River and connecting waterways." At the same time the commission held the case open and assigned further hearing for the purpose of securing evidence bearing upon the practicability of providing such rail transportation over existing lines.

The commission thus actually, in effect, ordered connection of the Youngstown district with the Ohio River, though it did not grant the Lisbon application. Rather, it has left it to the existing trunk lines, the Pennsylvania and the Pittsburgh & Lake Erie, to determine whether they will make the necessary connection. The Pennsylvania and Pittsburgh & Lake Erie already have land available, the former at Beaver, Pa., and the latter at Monaca, Pa., for the construction and operation of facilities

for the transfer of freight between barges and cars, which would afford rail-water-and-rail connection with the Youngstown district. At present coal carried over these lines to the Youngstown district from the Pittsburgh and Connellsville district is transported all-rail, the rate from the Pittsburgh district being \$1.34 per ton while the rate from the Connellsville district is \$1.43 per ton. The Lisbon railroad estimated that the average rate by use of its new lines would be about 60c. The Youngstown district consumes about 8,000,000 tons of coal annually from the two western Pennsylvania districts and the saving in the freight bill through such a reduced rate is readily seen. Limestone also would come into the Youngstown district from Ohio quarries over a rail-water-rail route.

It remains to be seen what the attitude of the trunk carriers will be or what step may be taken by the Lisbon railroad, owned and controlled by the Pittsburgh Coal Co., before the case is finally determined, or whether the new construction will be permitted. The commission said, however, that "the existence of low-grade lines operated by strong systems (the two trunk lines) between the mouth of the Beaver River and the Youngstown district suggests strongly that these lines should be used in preference to the construction and operation of an expensive new line. The utility of the proposed new line in the transportation of local traffic or in the development of the industrial territory at Youngstown would be relatively unimportant.

Commission Opposes Shipper Ownership of Railroad

The opinion prevails that the commission will not grant the Lisbon a certificate, provided the trunk lines establish the required water connection with the Youngstown district and grant reasonable rates on coal. Steel producers in the Youngstown district strongly supported the Lisbon application. The Youngstown Sheet & Tube Co. proposed to provide facilities at Smith's Ferry for unloading and loading purposes. The commission, however, said that the control of a common carrier by its principal shipper is to be avoided, thus implying that it would separate the Lisbon from control by the Pittsburgh Coal Co. It also declared it would consider, if further investigation were necessary, the matter of imposing a further condition that terminal facilities be provided on the Ohio River that are not under any industry or industries.

The apparent plan to separate a carrier from industrial control created considerable comment, and speculation went so far as to say that it indicated a policy of the commission that might affect industrial carriers and their owners throughout the country. Many industrial carriers and their ownership, notably the steel lines and the owning industries, have been the object of exhaustive investigations in the past. In the bulk of the cases, however, these "tap" lines were held to be common carriers, open to all traffic and not merely to that of the owning industries. Neither those cases nor the Lisbon case could come under the commodities clause of the act to regulate commerce because that clause prevents ownership by a railroad of an industry whose products it hauls and does not bear upon ownership by an industry of a railroad, though there has been some legal discussion as to the difference in effect.

Development of Waterways Favored

The commission decision in the Lisbon case was also taken to indicate growing determination to develop the waterways for transportation purposes as directed by Congress.

"The evidence shows that it is practicable and desirable that the Youngstown district should have access to the Ohio River by rail line or lines which will afford them substantially the transportation advantages, including rates, proposed by the applicants (Lisbon and Montour railroads) in this case," said the commission. "The advantages of the utilization of the Ohio and its connecting waterways have been amply demonstrated and the rail carriers should realize that they cannot continue to handle by all-rail routes much traffic which can be more economically transported by all-water or rail-and-water routes. The interveners express the fear that lower rates over a rail-and-water route will jeopardize the present rate structure, but, assuming such fear to be well founded, that fact would not justify us in withholding approval of any plant which promises to reduce substantially the cost of necessary transportation. It is also clear of record that the construction of the proposed new line would result in unnecessary duplication of facilities, if it is possible to make advantageous use of the existing lines of the Pennsylvania and the Pittsburgh & Lake Erie. The use of these lines between the Ohio River and the Youngstown district at reasonable rates would reduce the losses which the interveners apprehend through the diversion of their

traffic to the rail-and-water route proposed by the applicants."

At another point the commission said that public convenience and necessity, in the broader sense, require the combined use of all the agencies that can contribute to adequate and efficient transportation at the lowest cost. From the great and increasing use of the waterways of the Ohio River system, it was declared, it is clear that their development has been justified. It is also apparent, the commission added, that these agencies, which have been practically created by the Government, should as speedily as possible be made available to the public generally, through the establishment of common carrier service.

Youngstown Costs Have Risen

The commission briefly sketched changes in the iron and steel industry and rate adjustments over a period of years that had brought about a change in the competitive situation as between the Pittsburgh and Youngstown districts. Changes in rate adjustments and, apparently to a still greater extent, changes in the methods of manufacture of coke, it was stated, have impaired the ability of the Youngstown manufacturers to

market their products in competition with their rivals. Another important advantage of the Pittsburgh manufacturers, developed in recent years, is their ability to utilize the improved water transportation facilities on the Monongahela and Ohio rivers for transporting coal from mine to mill, as well as for moving their products in reaching territory to the south and southwest, said the commission. Replacing of beehive coke with by-product coke, it was pointed out, enabled manufacturers to dispense with rail transportation for coke, but the Pittsburgh manufacturers were declared to have gained the greater advantage by reason of the fact that they were able to move coking coal by barge. Coke, it was stated, does not lend itself to movement by water.

"To show the general effect of these changing conditions," said the decision, "it was testified that the transportation costs of assembling material for the manufacture of one ton of pig iron at Youngstown in 1913 amounted to \$2.37 and at Pittsburgh \$2.63. In 1918, with the use of by-product coke instead of beehive coke, these comparative figures had changed to \$3.28 for Youngstown and \$2.49 for Pittsburgh; and in 1928 they became \$4.44 and \$3.11 respectively."

British Machinery Makers May Oppose Steel Tariff

WASHINGTON, Dec. 24. — British makers of machinery and other engineering products, desirous of obtaining raw materials at the lowest possible prices to maintain their volume of exports in highly competitive markets, are expected to offer stiff resistance to the imposition of a tariff on imports of iron and steel products, according to a report received from Vice-Consul Wallace E. Moessener, Manchester, England. During the past year or more, the report stated, there has been considerable agitation in favor of imposing a tariff on iron and steel imports since foreign manufacturers in continental and other countries are able to undersell British manufacturers in the latter's home market. Reports that an import duty on machine tools may also be sought are heard from time to time, it was declared, but it does not appear that British tool makers will be able to obtain sufficient support to put such a duty in effect.

The report said that the United States is the principal supplier of British imports of air compressors, pneumatic tools, pumps, mining coal cutters, packing machinery, conveyors, cranes and hoists; machinery for grain milling, boot and shoemaking machinery, and glass working, wood-working, weighing papermaking and miscellaneous machinery. The United States occupies second place in supplying filter presses and ball and roller bearings. Germany leads in supplying hydraulic machinery and filter presses. Raw materials come principally from Belgium.

Enameled Metal to Be Considered

American Ceramic Society will meet Feb. 4 to 7 at the Stevens Hotel, Chicago. The latter three days will be devoted to divisional meetings wherein four symposiums and 95 papers are to be presented. Important groups of contributions relate to enameled cast iron products and to brick manufacture and testing.

By-Product Coke Output at Record Daily Rate

WASHINGTON, Dec. 20.—Amounting to 137,405 net tons, the daily rate of by-product coke production during the 30 days of November was the highest in the history of the industry, according to the Bureau of Mines. It showed a gain of 1 per cent over the daily rate of 136,105 tons for the 31 days of October. The total October output, however, exceeded that of November, having been 4,219,262 tons, against 4,122,150 tons in November.

Eighty-two plants active in November produced 88 per cent of their capacity. Total output of beehive coke in November was 416,000 tons, equivalent to a daily rate of 16,000 tons, compared with 15,593 tons in October. Production of all coke in November was 4,538,150 tons, of which 90.8 per cent was made in by-product ovens.

Quoting THE IRON AGE, the bureau pointed out that "pig iron production in November was 3,302,523 gross tons, a daily rate of 110,084 tons, the highest since early 1926. The November

production of pig iron was the highest for that month in any year since 1918."

Total coke was 1,374 net tons for each gross ton of pig iron in November, against 1,375 in October and 1,465 in November, 1927.

Institute of Metals Changes Date of Meeting

The council of the (British) Institute of Metals has found it necessary to change the date of the twenty-first annual general meeting and its "coming-of-age" celebrations from that originally announced, March 6 and 7, to March 13 and 14, 1929.

Following the sessions on March 13 there will be a dinner and dance at the Trocadero, and the next day will be featured by a conversazione and exhibition in the Science Museum, South Kensington. Objects of special interest in relation to the work of the institute will be displayed.

The annual May lecture of the institute is to be given on May 7 by Sir Oliver Lodge.

The annual autumn meeting will be held in Düsseldorf, Germany, next September. Offers of papers for that meeting are invited by the council, which, it is understood, will particularly welcome papers dealing with matters of practical interest. It is proposed also to hold at Düsseldorf a general discussion on laboratory methods in metallurgical research, in which speakers from many countries are expected to participate.

Applications for membership are now being submitted so freely, it is stated, that it is expected the total will reach the 2000 mark before Dec. 31.

Wholesale Prices Are Lower

November average prices of commodities, as reported by the United States Bureau of Labor Statistics, have an index of 96.7, compared with 97.8 in October. The November figure is identical with that of a year earlier. Reductions have occurred in six of the ten general groups. Textile products show no change, while there were slight advances in metals and metal products, building materials and chemicals and drugs.

Metals have reached 101.7, compared with 101 in October, because of increases both in the iron and steel classification, which went up from 95.1 to 96.1, and in the non-ferrous group, which advanced from 95.8 in October to 97.9 in November. There was no change in the three other subgroups under metals—agricultural implements, automobiles and other metal products.

A voluntary petition in bankruptcy has been filed by the Standard Crucible Steel Casting Co., 717 Thirtieth Street, Milwaukee. Schedules reveal liabilities of \$36,962, and assets of \$46,304 are claimed.

Program for Foundrymen's Convention

New Features Provided for Meeting at Chicago—Exhibit and Technical Sessions to Be Under One Roof

A DIVERSIFIED program has been arranged for the convention and exhibit of the American Foundrymen's Association, to be held at Chicago, April 8 to 11, 1929. All activities of the week—registration, technical sessions, dinners, banquets and exhibits—will be in the new Hotel Stevens, Chicago. All technical meetings will be on the third floor, with ample accommodations for simultaneous sessions. Registration headquarters and exhibits will be on the basement level, one flight down from the main lobby. All this will make it possible for members and guests to attend the meetings and inspect the exhibits without loss of time and the inconvenience always present when activities are scattered.

While exhibits will be limited as to space occupied, they will be as interesting as ever in character, with practically all regular exhibitors participating. The program as planned will be so full as to provide but little opportunity for general entertainment for the men, but the usual entertainment for ladies will be arranged for.

For Monday evening the annual exhibitors' dinner is scheduled. On Tuesday evening there will be a general session on foundry sands, preceded by a special dinner on the third floor. On Wednesday evening the annual banquet will be held, the social event of the convention. The usual provisions for plant visitation will be made under the auspices of committees of Chicago foundrymen. The tentative schedule for the convention program is as follows:

Monday, April 8

- 10 a. m. Registration.
- Opening of exhibits.
- 2 p. m. Committee meetings.
- 4 p. m. Cast iron and steel founding shop operation courses.

Tuesday, April 9

- 10 a. m. Foundry Costs.
- Steel Founding.
- Iron Founding.
- 12.30 p. m. Round Table—Non-Ferrous Cost Methods.
- Round Table—Steel Founding.
- 4 p. m. Sand Control.
- 6 p. m. Dinner gathering of those interested in sand control.
- 7 p. m. Foundry Sands.

Wednesday, April 10

- 10 a. m. Non-Ferrous Founding.
- Cast Iron Research.
- Materials Handling.
- 12.30 p. m. Round Table—Non-Ferrous Shop Practice.
- 2 p. m. Foreman Training.
- 4 p. m. Cast iron and steel founding shop operation courses.

Thursday, April 11

- 10 a. m. Malleable Iron.
- Apprentice Training.
- 12.30 p. m. Round Table-Malleable Founding.
- 2 p. m. High-Test Cast Iron.
- 4 p. m. Cast iron and steel founding shop operation courses.

Shop Operation Courses: The shop operation course on cupola practice, as tried out at the Philadelphia convention last May, proved to be of so much interest and value that the program committee has decided to broaden this type of meeting and conduct courses for both the gray iron foundrymen and the steel foundrymen at the coming convention. Each course will consist of four meetings and instruction in the fundamentals of shop practice will be given.

Round-Table Luncheon Meetings: Round-table meetings permitting informal discussion of shop problems have proved such a success in the malleable and non-ferrous branches that a similar meeting is being arranged for the steel foundrymen who attend the convention.

Foreman Training: Foreman training, a subject of increasing importance to foundrymen, will be given a place on the program this year. Several men prominent in foreman training have been secured to tell our members how training programs can be made worth while. Those who have consented to appear on this program are:

A. B. Pierce, director department of industrial education, National Metal Trades Association, Chicago; M. H. Mellen, superintendent of education General Electric Co., West Lynn, Mass.; A. D. Lynch, director of personnel Ohio Brass Co., Mansfield, Ohio; W. F. Coleman, W. A. Jones Foundry & Machine Co., Chicago; L. A. Hartley, director of education National Founders' Association, Chicago.

With such speakers this meeting is expected to be one of the outstanding sessions in the history of our association.

Apprentice Training: The "why" and the "how" of foundry apprentices will be brought out at the session on training foundry apprentices. J. A. Davies, general superintendent of the Philadelphia branch of the Westinghouse Electric & Mfg. Co., will explain the why and A. M. Cornell, vice-president Pettibone-Mulliken Co., Chicago, will show how training can be carried on. Other speakers will discuss further details.

Non-Ferrous Foundry Costs: As the gray iron, steel, and malleable cost methods have been given prominence at former cost sessions, the program calls for a consideration of ways and means of getting the non-ferrous foundry operators to consider the use of a uniform cost-finding method. Following the regular cost session, those interested in non-ferrous costs will get together at a luncheon meeting.

Sand Control: Breaking a precedent of many years' standing, a technical session will be held as an evening meeting. The subject to be discussed is that of sand control. The evening meeting was scheduled in order that all who are interested might attend without conflicting with their attendance at other sessions. Preceding the evening session, a meeting on sand control will be held at 4 p. m., which will be for the purpose of explaining the fundamentals of sand control and how sand control may be started in foundries.

Metallurgy and Shop Practice: The usual technical and shop practice sessions will be held covering developments in the iron, steel, malleable, and non-ferrous branches of the industry.

AMONG the numerous safety devices used on various classes of machines at the Bridgeport works of the General Electric Co. is the swinging gate guard for board or belt drop hammers, illustrated at the left. A single operating handle controls the gate guard as well as the safety dog just behind it, which prevents the large 500-lb. hammer from dropping. Thus with one motion the dog is thrown out of the way and the gate closed. The illustration shows the gate swung back to the right, with the safety dog just behind it.

This Issue in Brief

Wasted time is reduced by requiring employees to account for every minute of their time. The psychological effect of knowing that every minute is recorded is conducive to best effort, with resulting minimum costs. A simple job ticket suffices, the worker stamping it at beginning and completion of work. The ticket serves the double purpose of a progress report and cost record. — Page 1628.

* * *

Why some plants fail to avail themselves of the savings new equipment would earn. They consider only the reduction in machining cost when deciding whether to purchase a new machine, whereas time saved in subsequent assembling operations, as well as reduced repair cost, should be considered, also.—Page 1628.

* * *

In new strip mill, strip is pulled through galvanizing tanks at a constant speed by means of an automatic control. Motors are slowed down as the coils increase in diameter.—Page 1630.

* * *

Failure of coiled springs of the heavy, helical type is commonly due to overloading at the inside of the coil, metallurgist believes. He finds that stresses at the inside diameter of the springs may be 2.5 times as large as at the outer diameter.—Page 1635.

* * *

Inertia in management is responsible for neglect of opportunities for improvement in many plants. Improvements in production control, while perhaps more to be expected in the small plant than in the large, or by no means so confined. The large plant has great opportunities for improvement, in almost every instance, says journalist.—Page 1628.

* * *

Feed should be against the rotation of the cutter, not with it. Thus a tendency to dig in is avoided. This has been good practice for many years, but there is a tendency away from it of late years.—Page 1636.

Carburization is caused by diffusion of carbon soot, atom by atom, into the hot iron, entering the solid solution as austenite, according to experiments made by Japanese metallurgist.—Page 1634.

* * *

Even heating of alloy blooms is insured by soaking chamber which forms part of reheating furnace. The soaking chamber, the third of three zones of the main furnace chamber, is fired with only sufficient heat to offset radiation losses. It insures even heating and makes independent of each other the temperature conditions of the steel and the tonnage output.—Page 1632.

* * *

Work routing is simplified by giving every machine a number. Number should be carried on departmental operation sheet, as well as on time-study sheets. Machines of similar capacity should be grouped. This enables the department foreman to route work and shift work as necessity dictates.—Page 1628.

* * *

Fixtures should be designed so that the rotation of the cutter will be against the solid part of the fixture, not against the clamp. This principle is often violated, as the wrong way is usually more convenient.—Page 1636.

* * *

Spring strength is much reduced by even mild corrosion. Strength of spring steel is much higher in its quenched and tempered condition than in annealed state. But the advantage is more than lost if the metal is subject to even a mild corrosive action.—Page 1635.

* * *

To cut machining costs be sure that your fixtures may be loaded and unloaded quickly. To accomplish this, clamps which have considerable motion should, to clear the work, have a rapid action when free from the work and a slow motion with increased power when they are brought into contact with it.—Page 1637.

Shop efficiency is promoted if department foreman is furnished with a proper description of operations to be performed on any one piece. Operations, designated by number, should appear on operation card in logical sequence. Tool numbers of the fixtures and tools should be given, also.—Page 1628.

* * *

Makes automobile body scrap into toys. From 50 to 75 per cent of sheet material formerly scrapped in a Cleveland body plant is now used in making all-steel toys. As the first half of year is busy season in automobile body business and the second half in toy season, production curve has been smoothed out.—Page 1624.

* * *

Production increase is obtained by equipping open-hearth furnace with auxiliary hearth, says English steel-maker. The metal, be it scrap or hot iron, is preheated before being discharged into the main hearth.—Page 1626.

* * *

To realize the full possibilities of a cost-reducing plan, provide for a reward and encouragement to those who carry it out. For, in general, all human endeavor is directed toward the reward it brings.—Page 1628.

* * *

Condemns "jungle ethics" of price cutters. "They (price cutters in the steel industry) pursue the shadow of capacity operation and crucify the substance of a sane, average profit on the cross of unintelligent . . . competition," says association head.—Page 1649.

* * *

Sheet steel prices may be expected to be sufficiently reduced to make possible the use of sheets for a multitude of new uses, if present indications are borne out by experience, says machinery builder, speaking of sheet mill developments. The new method is heavily patented, and "it would be unfortunate indeed if the situation were handled in any but the broadest, fairest manner. . . ."—Page 1626.

ESTABLISHED 1855

Appraising the Forecasts

WE are in the season of trade forecasts and the wise reader will endeavor to appraise them in the light of the working out of forecasting in past years. Judgment will be according to two points; whether forecasts have shown any consistent tendency to err on one side or the other, the brighter or the darker, and whether they have been borne out with sufficient closeness to justify much reliance being placed upon them in future. Reference of course is here made to forecasts by men who are well posted and whose main object is to tell the truth as they see it.

We have checked over forecasts made by some eminent authorities one year ago and two years ago, i.e., forecasts for 1927 and forecasts for 1928, and compared them with the outcome. On the whole the showing is favorable to the forecasters.

The year 1928 has been a good year and the forecasts a year ago had it so. There was a note of confidence in the utterances and that is made more noteworthy by the fact that this was a presidential year and there had long been a rather widespread opinion that being a presidential year is a distinct handicap.

The forecasts for 1927, on the other hand, had been rather unfavorable. Generally the forecasters spoke of the year as a whole and predicted that it would not be so good as 1926 had been. They were right, broadly speaking, in their statements, but they missed the important point of the two halves of 1927 being quite different. The first half was fairly good, while the second half was distinctly poor. Steel ingot production lost less than 1 per cent from the first half of 1926 to the first half of 1927, whereas from the second half of 1926 to the second half of 1927 it lost 13 per cent. Freight car loadings ran ahead until May, so that the half year showed a slight gain, while the second half was fully 6 per cent under the second half of 1927.

One may be disposed to set a mark against the forecasters for missing this point, but there is another way of looking at it. Apparently they did recognize the underlying conditions and properly appraise their outcome. It would seem that they did not realize how far ahead they were looking. One might say they did not make sufficient allowance for the momentum of business, the year 1926 having been a very good business year, setting up such a pace that it required time for adverse influences to work out into decreased trade. Now, the superficial way to predict is to look things over and predict more of the same, whether good or bad. That the forecasters did not do.

In no sense are the present remarks intended as a forecast, their sole object being to suggest how the

forecasts of authorities should be received; but it does seem that we have a set of conditions which while quite different in detail from those of two years ago have this in common, that there is much momentum while some adverse influences have arisen lately. The year 1928 was good in its first half and has been still better in its second half, which means that there has been a gaining in momentum. We shall see now whether the forecasters are disposed to distinguish between parts of the new year. It is convenient to consider a calendar year as a unit but there is no fundamental reason for a year to be uniform in coloring, yet different in coloring from an adjacent year.

Changed Buying in Steel

TWENTY years ago the steel trade of the United States was about to emerge from a very curious situation. In recalling it, the average man would be likely to mention it as "the Gary dinner period," but really the "Gary dinner" movement was simply a means of averting distress. The condition was that of a very light demand upon the steel mills, which in great part was due to the existence of large stocks of finished steel and of large stocks of manufactured wares, such as are sold or distributed, while there was in essence another stock, that of manufacturing and transportation equipment not needed for a time. Jobbers and manufacturing consumers had little occasion to buy steel because they had stocks; their customers had little occasion to buy because they had stocks, and manufacturers and transportation interests had no occasion to add to equipment because they had too much already.

It is the existence of these large stocks to which we wish to direct attention, for present-day methods of conducting business are so different. For several years past there have been virtually no stocks of anything. All along the line "service" is demanded. The average time between the casting of the steel ingot and the rendering of service by the thing produced is but a fraction of what it was twenty years ago.

Production of pig iron in 1908 was 38 per cent less than in 1907 or 1909, those two years having been approximately the same. According to THE IRON AGE blast furnace reports at the time, the steel companies produced 1,514,521 tons of pig iron in October, 1907, their record high, while two months later, in December, they produced only 659,459 tons, only 44 per cent as much. It was not until the following December (1908) that they got back to seven figures for a month's production.

Superficially the appearance was that the stoppage

of things was due to the financial and stock market panic of late October, 1907. As a matter of fact there had been evidence quite early in the year that altogether too strong a pace had been followed. The Steel Corporation's unfilled obligations had reached a maximum on Jan. 1, 1907, at 8,489,718 tons and fell quarter by quarter until they were only 6,425,008 tons on Oct. 1, more than three weeks before the panic occurred. Afterward they declined to 3,313,876 tons July 1, 1908.

There was no such decrease in general trade as in the production of steel. Undoubtedly the actual ultimate consumption of steel in 1908 was much greater than the production. The difference lay in liquidation of stocks of steel and of manufactures of steel.

One cannot conceive of trade nowadays ever working itself into such a position. Stocks are not being carried now and it is extremely improbable they ever will be. Sweeping changes in the manner of doing business would have to occur first, so that there would be ample warning.

It is evident how much better off we are today, how much more economically and efficiently manufacturing and distribution are conducted and how there is no chance of a great manufacturing industry being forced to cramp down simply to allow time for goods it has already produced to be put into use. Consumption will have its ups and downs, though smaller than in the past, but demand will vary only as consumption and not more widely as it used to do.

Misery in Mining Towns

TOGETHER with daily information about King George's illness, American newspapers are carrying stories about the poverty, even starvation, existing among British coal miners. As the culmination of four years of declining production, about 250,000 miners are now unemployed (one in every four), and the remaining workers are getting such meager wages they are demanding increases which an almost prostrate industry is unable to grant. Relief is being organized on a national scale to feed the unfortunates through the winter.

Our contemporary in London, *Metal Industry*, thinks that the causes for this situation date back several years, chief among them being that the mines have been "over-manned; the coal output superabundant, leading to great waste"; and that an unsuccessful attempt has been made by both the miner and employer to maintain "advantages in comfort and in leisure over his European fellows." The editor also sees similar forces acting in the steel and cotton industry, and fears for them a dark future.

Normally such a plight would bring financial help from coal miners in this country, but unfortunately the organization of mine-workers fitted to collect and forward such charity is in trouble itself, and for similar reasons, namely: too many miners, requiring too high wages, in an industry expanding slowly yet installing machines to save more and more of the high-priced labor.

While the distress so widespread now in England may exist in America only in isolated spots, we will be fortunate indeed if it does not get worse before it gets better. Most of our industries are working at good speed, and the miner who is adaptable and willing to

work at another job has a fair chance of earning a living. Unluckily, general industrial conditions in England do not afford a similar shift.

A counteracting influence on both sides of the ocean is inertia—a man no longer young has little desire to uproot his life and start out anew. But the sooner such changes forced by broad economic movements are made, the better it is for the individual, the industry, and the nation. We in America thus have the opportunity to avoid much misery if we are forehanded in this business of transplanting the idle miner.

Fancy Prices for Copper

COPPER purchasers are finding that hand-to-mouth buying, which has worked so well during the post-war years, has its limitations. It has been fine to let the producers carry the stocks, as long as the stocks were ample for prompt delivery. As a matter of fact, the statistics (which have been quite precise for nearly ten years) have indicated a continually shrinking reserve of spot copper, and a continually increasing consumption. Thus, whereas the stocks of refined copper in America at the end of 1920 amounted to about 25 per cent of the world's production for that year, the corresponding figure today is as low as 2¼ per cent. Nevertheless during the last five years the price has been low and relatively stable.

This refinery situation has gradually come about by the intelligent use of copper statistics by the producers, whereby each one has been able to regulate his volume of production to the expected consumption. The purchasers, however, did but very recently awake to the fact that all the spot copper in the American refineries would supply no more than three weeks' home needs. Thereupon they rushed to buy, and the price promptly jumped.

As 1928 ends copper and brass mills are paying the miners three cents a pound more than the average price for 1927. This three cents will have to be charged off as the cost of letting the refiner carry the stock of raw material, and eventually the public will pay for this purchasing attitude.

While the price seems to be stabilized for the present at about 16 cents, the situation has many elements of danger. It should be emphasized that there is no necessity for a runaway copper market, nor do the producers wish to see one. All the prominent factors are convinced that price stability is far better than violent fluctuations. If "hand-to-mouth" purchasing has successfully fed the consumers' production schedules for several years past, there is no need now to rush in a larger margin for future operations. It will cost more than the fancied insurance is worth.

Another thing to remember is this: that no matter what premium may be offered, refinery production cannot be expanded instantly. Lake copper might respond quickest; copper from South America comes out more leisurely. On the average, copper mined on New Year's day is not out of the refinery furnace until April.

Thirdly, there is sufficient capacity in mines, concentrators, smelters, and refineries to produce all the copper which will be fabricated in 1929. Even the refinery capacity is 10 per cent greater than the present rate of consumption.

Lastly, the present price of 16 cents is an ample incentive for the producer to supply every legitimate

demand for copper. Red metal from North and South America (which is 70 per cent of the world's production) is made at an average cost of 10.5 cents. As Arthur Notman points out, the 90-year history of the domestic industry proves that a surplus of 3.65 to 3.75 cents for bond interest and dividends is satisfactory to the owners and creditors. A fair conclusion, therefore, is that the copper industry would be maintained in very healthy condition with the metal selling around 14½ cents a pound.

These considerations, viz., that no one wants a fluctuating market, that expansion in production must be gradual, that there is no possibility of a famine, and that the present price is ample, all urge the necessity of calm and considered action in the copper market.

CORRESPONDENCE

Blast Furnace Metal for Castings

To the Editor: The interesting discussion in your Dec. 13 issue, by David Baker, of the use of hot metal from the blast furnace by the foundry, reopens a most important field of development in foundry practice. It is one that should attract the attention of every large foundry operator in this day of mass production and lowering costs.

The problem as it relates to the foundry is closely analogous to that of the use of hot metal by the steel mill. The blast furnace operation is a smelting one, while the processes in the rolling mill are chiefly mechanical. Today, the steel mills obtain the greater part of their pig iron requirements in the molten condition from adjacent blast furnaces. The gap between the metallurgical operation and mechanical operation is successfully bridged.

Iron founding is chiefly a mechanical art. The foundryman is a mechanic, not a melter. His paramount interests are the making of molds and the production requirements

pertaining to this effort. Therefore, it is only natural that he should give little thought to, or even resent, the introduction of changes in the conventional means by which his molten metal is provided. If it is necessary to provide facilities for holding, reheating or mixing the hot metal in order to adjust composition or temperature, they are already developed. In this connection it is interesting to note the comments of no less an authority than Henry M. Lane in his paper before the National Founders' Association, as reported in your issue of Nov. 29, on the application of indirect-arc type (Detroit) electric furnaces to the production of gray iron from borings. In view of the difficulties experienced in the use of this material in cupolas, it is hard to account for the fact that the development is only a recent one.

The foundryman's attitude toward the composition of his iron is often paradoxical. When things go smoothly, little attention is paid to the analysis, but when the percentage of scrap goes up, then is the time to question the effect of silicon or carbon. As a matter of fact about five per cent of foundry troubles are due to composition of the metal. We hold our malleable iron, an alloy in which composition is certainly more of a factor than most gray iron, so closely on analysis, that the monthly averages do not vary more than 0.05 per cent in silicon nor 0.15 per cent in carbon. Yet we still have scrap and can find some hard castings and "picture-frame" iron. If the tonnage warranted, I feel that equally satisfactory results could be obtained from direct metal with some adjustment of composition and temperature in an electric furnace.

Nevertheless, new advances will be made in the foundry art. The wasteful reheating of cold metal will be eliminated and the foundryman will lose his fear of the effect of the unknown element in his iron if the hot metal is provided from blast furnaces, run under proper metallurgical supervision. The mechanical and metallurgical viewpoints will be reconciled and the production of iron castings on a more economic basis will be undertaken.

As an international authority on blast furnace practice, Mr. Baker has brought to the attention of the iron foundry industry, a development in the art which should receive serious consideration.

W. F. GRAHAM,
Ohio Brass Co.

Mansfield, Ohio.

Boston Scrap Exporter Reports Good Business

One of the iron and steel scrap dealers in the New England district who has been exporting sizable tonnages of scrap during the year, the J. Lipsitz Co., Chelsea, Mass., states that it has shipped a total of 28,000 tons for export in nine months of 1928 and has 5000 tons which will be moved before Jan. 1. The company says: "The largest steamer we shipped was the Casmona, which went to Genoa, Italy, with 7038 gross tons. The rest of the material shipped during the year went to Danzig. The total of 28,000 tons was shipped in the first nine months of the year, beginning about March 10. The total amount of scrap shipped to Danzig from Boston, according to my records, is approximately 40,000 tons.

"This export business depends entirely upon the steamship market, whether or not steamers are available at reasonable rates. When the steam-

ships get the grain business during the fall, it prohibits the shipment of scrap, as they run up the rates because of easy loading and securing tonnages at a moment's notice during the fall.

"However, we feel that 1929 will surely see exports of fully 50,000 tons of scrap from Boston."

Armco Distributors Meet to Discuss Service

Methods of improving the service of distributors to sheet metal shops were discussed at the annual convention of the Armco Distributors' Association of America in Middletown, Ohio, Dec. 4, 5 and 6. Members who addressed the convention were Guy P. Bible, Horace T. Potts & Co., Philadelphia; D. S. Gaston, Follansbee Brothers Co., Pittsburgh; O. J. Arnold, Arnold & Co., Baltimore; J. O. Kilian, A. M. Castle Co., Los

Angeles; Bruce Haines, Hammond Sheet Metal Co., Fort Smith, Ark.; G. L. McKewin, Farwell, Ozmun, Kirk & Co., Minneapolis; F. O. Schoedinger, F. O. Schoedinger Co., Columbus, Ohio; and M. L. Wolfe, Berger Brothers Co., Philadelphia. G. W. Breiel, managing director of the association, discussed the organization's activities during the past year. Armco men who spoke at the business sessions were W. W. Sebald, vice-president; Bennett Chapple, vice-president; D. M. Strickland, manager development department; and G. F. Ahlbrandt, general manager of sales.

Officers elected for 1929 are: A. W. Howe, J. M. & L. A. Osborn Co., Cleveland, president; Quincy W. Wales, Brown-Wales Co., Boston, vice-president; George O. M. Johnston, McClure-Johnston Co., Pittsburgh, secretary-treasurer; and G. W. Breiel, Middletown, Ohio, managing director. Mr. McKewin, Mr. Haines and Mr. Johnston were elected directors.

Speeding Up Railroad Freight Service

"The results of operation in October show that the railway transportation machine of the country is working more efficiently than ever before," says the *Railway Age*. "The real test of each year comes in the last one-third of the year, and usually in October, because usually the peak of the traffic movement is reached in that month. The number of tons carried one mile in October exceeded 48,200,000,000 and was the largest in any month in history excepting October, 1926, in which it was exceeded by only two-tenths of one per cent. The total number of freight cars the railways had on their lines was about 46,500 less than two years previously, but the cars were moved an average of 36.2 miles per day, which surpassed all previous monthly records.

"It is owing to this record-breaking average daily movement per car that the railways, although having available a smaller number of cars, were able to handle the peak movement while maintaining about the same car surplus as two years before. It is interesting to note how completely, in actual performance, the railways have surpassed one of the standards of efficiency in operation that they formerly adopted. When the presidents of the railways, in the spring of 1923, adopted their comprehensive program for increasing the efficiency of operation and rendering an adequate freight service, one of the goals they set was an average daily movement of freight cars of 30 miles. Average miles per car per day in 1920 had been 25.1 and in October of that year 28.6. In the year 1922 it had been 23.5, and in October of that year 26.6. The average attained in the entire year 1923 was 27.8 miles per car per day, and in October of that year a new high record of 30.7 was set. The average mileage per car per day in the first ten months of this year was 31.2; and the new high record of 36.2 in October was 26 per cent better than in October, 1920, 36 per cent better than in October, 1922, and 18 per cent better than in October, 1923.

"The figures reflect prompter loading and unloading of cars by shippers as well as more rapid handling of them by the railways, and show that the freight of the country is being handled with constantly increasing speed. The result is that the length of time each ton of freight is in transit is being shortened, which not only reduces the length of time the investment in it is tied up, but also enables business concerns to reduce the stocks carried by them and the investment in these stocks.

"It has required a large investment by the railways and many improvements in operating methods to effect the speeding up of transportation service that has occurred, and this speeding up of transportation service has had numerous and far reaching effects

upon the industry and commerce of the country."

Mechanical Standards Council Organized

Sixty organizations interested in standardization in the mechanical engineering field were invited to join the Mechanical Standards Advisory Council, and a large percentage accepted and sent official delegates to the permanent organization meeting held Dec. 3 at the Engineering Societies Building, New York.

What, when and how to standardize, to the general economic advantage and without embarrassment to the financially concerned interests in the mechanical field, are the basic questions which the mechanical industries undertook to solve.

The functions of the Council, as outlined in the constitution adopted at the meeting, are as follows:

1.—To endeavor to obtain, at the request of any interested group, the desired cooperation of organizations in any standardization project in the mechanical field.

2.—To confer with any organization in the mechanical field interested in or carrying on work which eventually may be presented for action under the rules of procedure of the American Standards Association.

3.—To advise the American Standards Association on questions of policy relating to standardization applying to products of the mechanical industries.

4.—To serve as a general coordinating medium in the mechanical field, within the scope of the constitution, by-laws and rules of procedure of the American Standards Association.

5.—To consider (a) the desirability and practicability of standardization projects within its field; (b) the order in which standards shall be developed; (c) the scope of projects; (d) sponsorships for the necessary sectional committees; and (e) the adjustment of conflicts and the clearing up of ambiguities.

6.—To follow up and expedite work in the development of standards.

Representatives of the Society of Automotive Engineers, National Machine Tool Builders Association, American Standards Association, Manufacturers Standardization Society of the Valve and Fittings Industry, American Society for Testing Materials, and American Society of Mechanical Engineers were designated as the executive committee of the new Council.

The meeting held Dec. 3 was preceded by two conferences, held April 7, 1926, and June 20, 1928, respectively.

American Exports Gained Heavily in Some Lines

WASHINGTON, Dec. 24.—Some striking major trends in American foreign trade are shown in a bulletin, "Our World Trade," issued today by the Foreign Commerce Department of the Chamber of Commerce of the United States. These trends, as disclosed by a comparison of export and import figures for the first nine months of 1928 with the average figures for cor-

responding periods from 1923 to 1927, are:

"Nine-month exports by value this year are 8 per cent more than the five-year average, but imports are only 1.5 per cent greater.

"Exports of finished manufacturers by value gained 25 per cent, while foodstuffs exports fell 23 per cent.

"Canada, our best market, taking 19 per cent of our exports, gained 29 per cent over the average.

"Automotive exports by value are 77 per cent above the average; industrial machinery, 72 per cent; agricultural machinery, 54 per cent.

"Raw silk imports by quantity are 29 per cent above the average; wheat, 58 per cent; rubber, 12 per cent. Sugar is 11 per cent below the average.

"These trends, it is pointed out, clearly indicate that the foreign trade of the United States is forging ahead steadily, disproving predictions to the contrary made in 1921 and 1922—years of readjustment when uncertainty in American foreign trade gave rise to some doubts as to the permanency of enlarged international business.

"Our foreign trade for the first three quarters of 1928," the bulletin says, "totaled \$6,628,000,000, nearly 5 per cent greater than the average for the five corresponding nine-month periods of 1923-1927. Exports amounted to \$3,559,000,000, the largest since 1920, 1.4 per cent above 1927, and 8 per cent over the above-mentioned average. Imports amounting to \$3,070,000,000, though 2.7 per cent below the 1927 total, were still 1.5 per cent above the 1923-1927 average receipts. While our exports for the third quarter of 1928 exceeded one billion dollars for the seventeenth consecutive quarter, our imports for the quarter fell below one billion for the first time since 1924. Exports of foreign merchandise (re-exports), included with total exports, amounted to \$76,037,000, or \$4,830,000 lower than last year."

German Wire Rope Makers Form a Cartel

WASHINGTON, Dec. 18.—Certain German manufacturers of wire rope are reported to have formed a cartel for the regulation of the export trade with the Scandinavian and Baltic countries, according to a report received by the Iron and Steel Division, Department of Commerce, from Trade Commissioner James E. Wallis, Jr., Berlin. The cartel, organized in October, includes all of the large and medium-sized producers of wire rope.

A sufficient number of signed acceptances having been received from manufacturers, distributors and users of skid platforms, the Division of Simplified Practice of the Department of Commerce has announced that the simplified practice recommendation covering this commodity is now in effect.

Iron and Steel Markets

Production to Pass 50,000,000 Tons

Estimates of Steel Output for 1928 Revised Upward—

Holidays to Have Minimum Effect on Operations—

New Demands Promise Well for 1929

THE buoyancy of the iron and steel market is manifest in a minimum interruption of production for the holidays and in the welling up of new demands as the opening of the first quarter of 1929 draws near.

Railroad buying, structural steel contracts and inquiries, steel pipe orders, increased tonnage from farm equipment makers and renewed demand from the automobile industry stand out in the activity of the week. While new mill bookings, in toto, have shown some letdown in most districts, specifications are well maintained.

Chicago reports the month one of the best Decembers on record. Mill backlogs there are growing, notwithstanding heavy shipments and a production rate that holds at 85 per cent of ingot capacity. In other centers, some mills report larger shipping orders than in November and producers, generally, will have substantial tonnages still unfilled on Jan. 1.

The holiday interruption of mill operations will vary from one or two days to a full week, with the shorter shutdowns in the majority. Aside from this factor, plant engagement is holding its own, making it virtually certain that steel ingot output for the year will not merely approach 50,000,000 tons, but will exceed that figure by a comfortable margin. The previous record, in 1926, was 46,936,000 tons.

Buying interest in both the pig iron and scrap markets reflects a year-end lull. Old material remains strong, however, and at Pittsburgh heavy melting steel has advanced another 25c. to \$18.25 a ton, thereby passing the October peak. With heavy steel scrap commanding a higher price than pig iron, Pittsburgh district steel producers are using more iron in their mixtures and merchant furnace quotations on basic grade are strengthening.

Shipments of merchant pig iron are keeping up surprisingly well, in view of holiday and inventory shutdowns among foundries, and some sellers will start the new year with the smallest carryover of unspecified tonnage since the war. Furnace stocks are also low.

Railroad purchases include 2500 freight cars placed by the Louisville & Nashville. More than 11,000 cars (exclusive of about 6000 for Canadian roads) have been ordered in the past two months, or about 25 per cent of the total to date this year. The Delaware, Lackawanna & Western has placed 10,000 tons of rails and the Missouri Pacific has made formal distribution of 55,800 tons. Rails placed in the current buying movement are estimated at 1,000,000 tons. This total is

somewhat smaller than bookings at this time a year ago, but mills look for a compensating increase in purchases in coming months.

Fabricated structural steel awards, including 18,500 tons for the Chicago Board of Trade Building, total nearly 45,000 tons, and the pending list has been augmented by inquiries for 44,000 tons, featured by 32,000 tons for a Baltimore bridge.

A New Jersey aqueduct, tentatively awarded, calls for 38,000 tons of plates. A Milwaukee maker of electrically welded pipe has taken an order for a gas line requiring 40,000 tons, making a total of 174,500 tons recently booked by that company for five major pipe lines.

Farm equipment makers continue to increase their consumption of steel, and automobile parts makers are entering heavier specifications, particularly for forging bars, for delivery early in January. Motor car builders themselves are specifying more liberally for alloy steel bars and body sheets, and are preparing to increase operations, now at a reduced rate, after Jan. 1.

Bar specifications are reported gaining at both Chicago and Pittsburgh, with deliveries extending. The mid-month deadline on releases against fourth quarter contracts for bars, plates and shapes failed to hasten specifying because quotations for the coming quarter represent no advance in prices. In wire products and sheet bars specifications, which are being accepted until the end of the month, have been stimulated by price increases, but for the same reason first quarter contracting has been slow.

Stove bolts in packages, until recently quoted at 80, 10 and 2½ per cent off list, Pittsburgh, are now available at 80, 10 and 5 off, delivered Pittsburgh, Chicago and New England points.

Detroit has awarded 5700 tons of large-diameter cast iron pipe, of which 2800 tons of 36-in. was placed with a French maker at a price figuring back to \$31.98 a net ton, Birmingham. The remainder was let to a domestic producer at \$33.50, Birmingham.

Machine tool business in 1928 was the largest since 1919 and, for many manufacturers, the greatest since the war. The gain over 1927 ranges from 25 to 50 per cent. The automobile, aircraft and farm equipment industries were conspicuous buyers.

Both of THE IRON AGE composite prices are unchanged, that for finished steel at 2.391c. a lb., the highest level of the year, and that for pig iron at \$18.46 a ton.

Pittsburgh

Steel Industry Well Satisfied With Immediate Outlook— Holiday Shutdowns Limited to a Few Days

PITTSBURGH, Dec. 24.—Observance of the holidays has caused some let-down in new business in steel products, but no material decrease in specifications. Plant engagement in this and nearby districts suffers only to the extent of a general shutdown of rolling mills extending from last Saturday noon until Wednesday morning. Order books in sheets, tin plate and rails are heavy, and in the past week or so specifications for bars have increased substantially. The final week of the year finds the steel industry well satisfied with the immediate outlook.

A Pittsburgh district railroad car builder recently booked the first worthwhile order in almost a year; it will require approximately 20,000 tons of rolled steel. With other centers reporting increased interest in rolling stock, it seems likely that the railroads will be larger factors in steel buying than they have in the past year.

The agricultural implement industry is taking steel freely. Larger releases against orders for rolled steel, notably sheets, are coming from the motor car builders. Another pipe line order, involving between 400 and 500 miles of 22-in. pipe, is believed to be nearing the closing stage. The trade is counting on more demand next year from the oil and gas industry. In steel construction, other parts of the country appear more active than this territory.

Steel prices show no special change. It is a little early to get a clear line on the recent advance in wire products; although difficulty is encountered in getting buyers to sign first quarter contracts, it is not forgotten that they still have considerable tonnage due them on old commitments. Sheets appear firm. No trouble has been experienced in getting the advance on tin plate. In plates and shapes, the quotations have again become largely local to the Pittsburgh district, in

view of the recent reduction announced by a large Eastern producer.

Scarcity of scrap is reflected in prices, and with scrap already commanding more money than pig iron, the use of the latter will be increased. Merchant producers are taking a firmer price stand on basic iron, which, it is believed, will be very sparingly offered by steel companies ordinarily having a surplus for the market.

Pig Iron.—Business remains very quiet, but if melters are indisposed to buy, there is an equal amount of indifference on the part of merchant producers about selling. Prices are firm. The strength of the scrap market is not without effect upon the views of the merchant iron producers, who see a possibility of a contraction in the amount of steel company iron for sale if heavy melting steel continues to become more valuable. The Steel Corporation in the past year has become an important factor in the local scrap situation and is taking so much of the supply that was formerly available for general market sale that it is seriously questioned whether, with a normally full engagement of steel-making capacity, there is enough

steel works scrap to go around. Steel works operations, which are high for this time of the year, promise to increase after the holidays, and it is certain that more scrap or more pig iron must be used. Heavy melting steel is not now to be had at under \$18, and even more is asked. Any advance from that price would tend to increase the use of pig iron as the cheaper material and reduce the amount available for market. There is also the possibility that some of the steel companies, ordinarily self-contained, will have to buy pig iron; one company, which has only enough iron production to meet its open-hearth furnace requirements, is faced with the possibility of having to blow out a blast furnace soon for relining. Inquiry recently made by one steel company for basic iron disclosed no lower prices than \$17.50, Valley furnace. Some important melters of foundry iron yet are not under cover for the first quarter of next year. In the meantime, while new buying of all grades is light, deliveries on old orders are heavy. Willingness on the part of buyers to take shipments is commonly interpreted as evidence that they do not look for lower prices.

Prices per gross ton, f.o.b. Valley furnace:

Basic	\$17.50
Bessemer	\$18.25 to 18.50
Gray forge	17.00 to 17.50
No. 2 foundry.....	17.50 to 18.00
No. 3 foundry.....	17.00 to 17.50
Malleable	18.00 to 18.50
Low phos., copper free....	26.50 to 27.00

Freight rate to Pittsburgh or Cleveland district, \$1.76.

Semi-Finished Steel.—The holiday interruption to sheet and strip mill operations has meant no similar decline in specifications for billets, slabs and sheet bars. Indeed, in sheet bars buyers seem anxious to postpone paying the advance of \$1 a ton the makers have announced on first quarter contracts and are ordering freely on this quarter's commitments. There is a fair amount of first quarter contracting in sheet bars and not much resistance to the higher price. Contracting in billets and slabs also is developing a fair amount of activity.

With the price for the next quarter unchanged, no trouble is being encountered in getting wire rod consumers to sign up.

Hot-Rolled Flats.—Makers of strips are ending the year with fairly heavy order books as a result of specifications on this quarter's contracts driven in by a desire by buyers to save the price advantage of this quarter over the first quarter of 1929. Prices show some tendency to yield to the pressure of buyers, and the lower limits of the price ranges are more typical of the ruling levels than the higher ones.

Bars, Plates and Shapes.—Specifications on bars are good in spite of the holiday season. Automobile parts makers are specifying some good-sized January tonnages of cold-finished bars, and makers of the latter in turn are releasing hot-rolled bars. Demand from bolt and nut makers also is fairly active, and there is a fair amount of business from the jobbers. The market is quotable from 1.90c. to 1.95c., base Pittsburgh, on most of the Pittsburgh district business, 2c., base, being, for the most part, an asking price. Pittsburgh mills will get approximately 20,000 tons of plates, shapes and bars in the 1200 car order recently awarded the Pressed Steel Car Co. There is a fair degree of activity in plates and shapes; on local business, prices generally run from 1.90c. to 1.95c., but such prices cannot be obtained in competitive districts.

Rails and Track Supplies.—The Baltimore & Ohio Railroad has distributed the track accessories to go with the rails it recently placed. Local makers of spikes, track bolts and tie plates shared in the awards, which are reported to have been at full prices. Light-section rails are dull, but heavy rails are moving rather well on 1929 contracts.

Wire Products.—Manufacturers are well satisfied with the progress they have made in establishing the higher prices and the new method of sale recently announced on first quarter contracts. There has been a little

confusion here and there, and some disputes as to the price classification in which some distributors have found themselves, but, taken as a whole, not much resistance has been met in getting buyers to sign first quarter contracts. It is early for much specifying against them, since jobbers and large consumers have some tonnage still due them on this quarter's commitments.

Tubular Goods.—The pipe line to convey gas from the Monroe, La., field to St. Louis, requiring between 400 and 500 miles of 22-in. pipe, again appears likely to be closed soon. A subsidiary of the Standard Oil Co. of New Jersey is sponsoring this line. It is said to have secured a gas contract for a large plate glass plant now going up in St. Louis; one or two other industrial gas contracts will provide sufficient market for the gas to warrant the building of the line. In other directions, the market shows varying degrees of activity; butt-welded pipe is doing fairly well for the time of year, lapwelded pipe for oil country use is dull, but seamless oil country pipe is in demand.

Sheets.—The holiday season is accompanied by a rather substantial decrease in specifications for the common finishes of sheets, but has not affected the releases of those required in motor car and truck construction, and in the past few days there has been a notable gain in the orders for sheets for railroad cars. Mill operations have suffered from the holiday observance, but tonnage lately released will furnish substantially full operations for next month. Prices are holding well.

Tin Plate.—Several tests of the higher prices named on first quarter and first half tonnages have failed to shake them. Makers generally are well supplied with business, but mill operations are down somewhat since a week ago on account of the inability of mill managers to maintain full crews during the holiday season. Prices of tin plate for re-export are stronger by as much as 25c. per box, compared with those ruling on expiring contracts.

1925	22.50, Jan. 13;	18.96, July 7	
1924	22.88, Feb. 26;	19.21, Nov. 3	
1923	30.86, Mar. 20;	20.77, Nov. 20	

This is partly explained by higher prices abroad.

Cold-Finished Steel Bars.—Current business is light, but makers are getting liberal releases on tonnage for shipment after the turn of the year. First quarter contracting is moving without a hitch, chiefly because consumers are being called upon for no advance over what they now are paying.

Cold-Rolled Strips.—Much first quarter business has been written at 2.85c., base Pittsburgh or Cleveland, and that price still is generally regarded as the market, despite the fact that there have been a few deviations from it. Consumers are not taking shipments freely for the present, but have much tonnage on order for shipment after Jan. 1.

Coke and Coal.—Spot supplies of furnace coke still are quite ample for the demand and producers find difficulty in maintaining prices. There has, however, been some curtailment of production and only in a few cases has it been necessary for oven operators to go below \$2.75 per net ton at ovens for standard Connellsville coke. Spot foundry coke is dull, but that is the usual condition at this time of the year. Most of the first half Connellsville foundry coke production now is under contract. The coal market presents no important change, except that slack coal is a shade firmer under smaller offerings.

Bolts, Nuts and Rivets.—Stove bolts are being offered at 80, 10 and 5 per cent off list in packages, delivered Chicago or New England points, and that appears as high now as can be done by Pittsburgh producers. Prices otherwise are unchanged. First quarter contracting is fairly active, but current specifications are rather light. Large rivets hold firm at \$2.90, base, per 100 lb., less 2½ per cent.

Warehouse Prices, f.o.b. Pittsburgh	
	Base per Lb.
Plates	3.00c.

Cement coated nails, per keg	3.05

Old Material.—The market is very firm on the steel works grades. Consumer buying is light, but dealers, in covering on old orders, find offerings very limited, and they are not actively seeking new orders at current prices. No heavy melting steel appears available at less than \$18, and dealers would not sell a round tonnage at that price because so many former local sources of supply have been closed to them lately by direct mill purchases that dependence would be chiefly upon railroad lists or upon distant supply sources. Heavy melting steel cannot be had from either source now to be sold profitably at under \$18.50. This grade may be appraised at \$18 to \$18.50. Dealers are confident that even higher prices will be reached on the next large mill purchase, as available supplies are limited and neither the production nor the collection of scrap is as heavy at this season of the year as at others. The recent sale of compressed sheet scrap at \$19 has not been repeated, and in the past week \$18.50 has been the top on sales, with dealers reporting purchases at \$18 and \$18.25.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
Heavy melting steel.....	\$18.00 to \$18.50
Scrap rails	18.00 to 18.50
Compressed sheet steel....	18.00 to 18.50
Bundled sheets, sides and	
ends	17.00 to 17.50
Cast iron carwheels.....	15.00 to 15.50
Sheet bar crops, ordinary..	18.50 to 19.00

No. 1 railroad wrought....	13.50 to 14.00
Sheet bar crops.....	19.00 to 19.50

Cupola Grades:	
No. 1 cast.....	14.50 to 15.00
Rails 3 ft. and under.....	19.50 to 20.00

Production of electric energy by the New England Power Association in the first 11 months of 1928 was 1256 million kwhr., an increase of 24 per cent over the 1015 million kwhr. for the same period in 1927. About 52 per cent of the total was from hydroelectric plants. The "association" is a subsidiary of International Paper Co., New York. The growth of the system may be noted from the fact that the entire year's output in 1910 was equivalent to only 7 days' peak production in 1928.

Youngstown

Holiday Suspensions Brief Owing to Heavy Orders

YOUNGSTOWN, Dec. 24.—Because of heavy demands for sheets and strips, suspension of rolling mill capacity by Mahoning Valley mills is limited to Monday and Tuesday, with resumption in most cases scheduled for Wednesday. Sheet mills of the Falcon Steel Co., at Niles, a division of the Empire Steel Corporation, will resume Jan. 1, following several months' idleness. The Newton Steel Co., which originally planned to be down for the week, starts its units Wednesday, owing to heavy orders for full-finished sheets.

The Youngstown Sheet & Tube Co. has blown out for relining its Jeanette blast furnace at the Brier Hill Works, leaving 25 of 37 stacks in this district in blast. This company is planning elimination of its detached plant at Zanesville, consisting of two lap-welded and two butt-welded pipe mills, socket mill and auxiliary equipment.

District mills are well fortified with orders for first quarter and leaders of the trade are optimistic.

Ohio properties of the A. M. Byers Co., Pittsburgh, are idle for the week.

The steel industry in northeastern Ohio closes the year with steel ingot and rolling mill capacity active slightly above 80 per cent.

Motor Wheel Corporation Complaint Dismissed

The Federal Trade Commission has dismissed a complaint against the Motor Wheel Corporation, Lansing, Mich., charged with violation of section 7 of the Clayton act, which prohibits acquisition of capital stock in a competing company where the effect would be to lessen competition or create a monopoly. The Motor Wheel Corporation was charged with acquiring stock in Forsyth Brothers Co., Harvey, Ill., former manufacturer of steel wheels. Counsel for the corporation, appearing before the commission in a final argument last week, declared that Forsyth Brothers Co. had necessarily gone out of business and at the time of executing its contract with the Motor Wheel Corporation was not in competition with or in any sense a competitor of the corporation.

Experiments at the United States Forest Products Laboratory prove that knotty lumber will make a box with short, thick sides more resistant to rough handling than clear lumber, provided the boards have a slenderness ratio—length divided by thickness—less than 60. The laboratory's tests developed that clear boards are not flexible enough when subjected to rough handling to absorb the shocks produced by the box contents and relieve the direct pull on the nails.

Chicago

Structural Steel Award of 18,500 Tons—Mills End Year With Substantial Backlogs

CHICAGO, Dec. 24.—Of primary interest in this market was the placing of 18,500 tons of steel for the new Chicago Board of Trade Building. It is probable that upward of 12,000 tons will be awarded in a day or two for the No. 1 North LaSalle Building. Many pending projects are still open, with little possibility that they will be placed until after the first of the year. In the meantime, structural shops are feeling the pinch of small order books.

Based on preliminary estimates, it is evident that shipments of sheets from local hot mills in 1928 have established a record. Local warehouses are figuring on 1200 tons of sheets needed for forms for reinforced concrete work in the Chicago Mercantile Mart.

Local steel production is steady at 85 per cent of ingot capacity. Specifications are well above current shipments, and mill output will soon be increased. Chicago mills will shut down only on Christmas Day.

This month will be one of the best Decembers on record. Specifications and shipments have been steady, while backlogs have been growing, with the result that the approach to the first quarter is more favorable than has been experienced in many years. Although prices are not above the levels maintained in the fall months, they are showing greater strength. It is probable that users of finished steel products will find deliveries more extended in January than in December. Specifications in recent weeks have been unusually heavy, the bulk of this tonnage being for shipment after the turn of the year. Releases in the past week, while not as large as in the previous week, are 30 per cent heavier than the average week for the year and they are less influenced now by specifications for rails than was the case earlier in the month.

Pig Iron.—This market is enlivened by new inquiry and a few contracts for first quarter and first half. Most foundries have closed for two days at Christmas, but many will resume operations on Wednesday. In previous years it has not been uncommon for melters to shut down for a week or 10 days at this season. Reasons for the change in practice this year appear to lie in the general business situation and the fact that many foundries have sought more stable sources of orders and are depending less on the up and down character of job-lot business. Prices for Northern iron are steady at \$20 a ton, local furnace. Although most sellers are quoting \$24 a ton, furnace, for charcoal iron, there still are odd lots that can be had at a lower price.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25...	\$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75...	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail) ..\$22.51 to	23.01
Low phos., sil. 1 to 2, copper free..	29.50
Silvery, sil. 8 per cent	30.79
Bess. ferrosilicon, 14-15 per cent...	47.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—Prices for carloads of spiegeleisen are stronger because of heavy order books.

Prices delivered Chicago: 80 per cent ferromanganese, \$112.56; 50 per cent ferrosilicon, \$83.50 to \$88.50; spiegel-eisen, 19 to 21 per cent, \$40.76.

Coke.—Shipments of by-product foundry coke are steady. Preliminary estimates by local producers indicate that deliveries in 1928 will establish a record. Prices are firm at \$8 a ton, f.o.b. local ovens.

Bolts, Nuts and Rivets.—Few changes have taken place in this market in the past week. Specifications for delivery after Jan. 1 are heavier. Spot buying is at a standstill.

Wire Products.—Specifications for these commodities are steady, being little influenced by inventory taking. Automobile parts manufacturers in the Cleveland and Detroit districts are taking larger quantities in preparation for an expected increase in demand from makers of automobiles, several of which have already gone into greater production on new models. The jobbing trade is quiet in most sections of the country, it being quite evident that stocks in the hands of distributors are ample to carry them over the holidays. Mills have increased stocks in recent weeks, but of late have cut output to 60 per cent of capacity to more nearly balance with current shipments. Producers' warehouses are better able to meet demands than earlier in the month, but stocks are lower than usual at this time of the year, bearing out the contention made by sellers earlier in the fall that they would meet spring demands by increased production rather than by drawing from stocks built up during the winter months. Shipments and new orders for woven wire fencing are lighter, and the nail demand from rural districts has fallen off sharply. Many users of wire and wire products who have old contracts are specifying freely in an effort to take advantage of the old prices. New sales are small in the aggregate, but on the business taken prices have held.

Reinforcing Bars.—Business in the last week has been confined largely to signing contracts placed just prior to Dec. 15, when quotations at old price levels expired. Billet steel reinforcing bars are steady at 2.35c. per lb. in carload lots out of Chicago ware-

houses, and it is reported that all lower prices have been withdrawn. In rail steel bars, however, the situation is less clearly defined, with warehouses quoting 2.05c. per lb., and with some old quotations still in the hands of prospective purchasers. Among the active pending jobs is 450 tons for the Fine Arts Building, Chicago. Bids have been rejected for a second time on five Chicago junior high schools, which will take about 1500 tons.

Sheets.—Chicago mills are closing the year with a total production that is near, if it does not exceed, the best previous 12-months' record. Although hot mill operations have not been at capacity in recent months, they have been relatively steady, affording little or no time to make extensive repairs. Several mills will take advantage of the holiday season and will be shut down from Dec. 22 until Jan. 2. Inquiry is developing more rapidly, but forward contracting has reached only about one-half of the tonnage that is normally on books for the first quarter. Prices are holding on business taken for delivery after the first of the year. There is every indication that stocks in the hands of users are small, therefore producers are looking forward to a sharp upturn in demand by the middle of January.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.00c.; No. 24 galv., 3.75c.; No. 10 blue ann'd, 2.25c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—Detroit has closed for 5700 tons of large size cast iron pipe. A bidder offering French-made pipe has been awarded 2800 tons of 36-in. pipe at \$39.90 a ton, delivered, which figures back to \$31.98, Birmingham. The United States Cast Iron Pipe & Foundry Co. has taken 800 tons of 36-in., 1500 tons of 24-in. and 600 tons of 48-in. pipe at \$41.42 a ton, delivered, or \$33.50 a ton, Birmingham. Milwaukee is scheduled to open bids on a large tonnage on Dec. 28. On the whole, this market is quiet. Scattered car lots have been taken at \$37 to \$38 a ton, Birmingham. According to sellers, the indications are that a substantial volume of business will come into the market before the end of January. Many engineers are reported to be busy in preparing plans for spring pipe laying programs.

Prices per net ton, deliv'd Chicago: Water pipe, 6-in. and over, \$42.20 to \$46.20; 4-in., \$46.20 to \$50.20; Class A and gas pipe, \$4 extra.

Structural Material.—Fresh inquiry totals 9000 tons and awards are not less than 5000 tons. The expansion of industrial building is further shown by inquiries for steel for an addition to a tractor plant and an open-hearth building. Shops in Milwaukee are reported as busy, while to the west of Chicago output is far below capacity. Local shops are well engaged for this time of the year, but backlogs are small, and all but two or three fabricators will be in need of work before the end of January. Shops are swinging into heavier fabricating schedules on the 38,000 tons of steel

which is to be used in the Mercantile Mart, Chicago.

Mill prices on plain material, per lb.: 2c. to 2.10c. base, Chicago.

Plates.—Welded pipe makers are making heavy drafts against plate contracts held by local steel producers. Plate mills are well engaged when it is considered that recent car purchases have had little bearing so far on schedules. An oil producer in Texas has ordered 1700 tons of plates for storage tanks to be fabricated in the Southwest. Inquiry for steel for large oil storage tanks totals 10,000 tons, the bulk of which will go into the Texas fields. Deliveries on wide plates range from two to four weeks.

Mill prices on plates, per lb.: 2c. to 2.10c. base Chicago.

Rails and Track Supplies.—The local rail market is quiet, except for the arrangement of rolling schedules for 1929 deliveries. Outstanding inquiry remains at 50,000 tons. It is estimated by local sellers that about 1,000,000 tons has been purchased for next year's delivery. It is believed by some this figure is less than the tonnage which had been placed by this time a year ago, but others point to the fact that several large railroads made purchases with large options for 1928. These options were not specified in full. This year these railroads have made purchases plus options, which totals about equal to actual shipments made to them in 1928. Rail mill deliveries in 1928 were heavier than in 1927, and it is generally believed here that 1929 shipments will fully equal those in 1928. Miscellaneous orders for track supplies total 5000 tons and inquiry stands at 16,000 tons. Rail output is a shade higher at 61 per cent of capacity. Track accessory departments are operating at a steady rate, with schedules that indicate an upturn in production about the middle of January.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, \$43; light rails, rolled from billets, \$36. Per lb.: Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Old Material.—Prices in Chicago for iron and steel scrap are well maintained. Some specialties, such as rail-

road malleable and machinery cast, have advanced 25c. a ton on recent sales. A round tonnage of cast iron borings has been taken by a consumer at \$12.50 a gross ton, delivered, an advance of 25c. a ton. The supply of heavy tonnage grades seems to be ample to meet users' needs, but dealers are having some difficulty in obtaining carloads of specialties. This is due in part to lower shipments by producers, who are holding scrap to get better car loadings; freezing weather also is playing a part in hampering preparation and shipment. Lighter deliveries are noted to foundries, which at this time of year usually curtail output. Inquiry for immediate delivery is less urgent, but buyers are showing greater interest in the possibility of getting prompt shipments soon after the first of the year. It is noteworthy that most consumers feel confident of the future, and in many instances have well prepared plans for shop schedules for the early part of January.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:		
Heavy melting steel.....	\$14.50 to	\$15.00
Shoveling steel	14.50 to	15.00
Frogs, switches and guards, cut apart, and misc. rails	15.75 to	16.25
Hydraul. compressed sheets	13.00 to	13.50
Drop forge flashings.....	10.50 to	11.00
Forg'd, cast and r'l'd steel carwheels	17.75 to	18.25
Rail'r'd tires, charg. box size	17.50 to	18.00
Rail'r'd leaf spring cut apart	17.50 to	18.00

Acid Open-Hearth Grades:		
Steel couplers and knuckles	16.00 to	16.50
Coil springs	18.25 to	18.75

Electric Furnace Grades:		
Axle turnings	14.50 to	15.00
Low phos. punchings.....	16.75 to	17.25
Low phos. plate, 12 in. and under	16.50 to	17.00

Blast Furnace Grades:		
Axle turnings	12.00 to	12.50
Cast iron borings.....	12.00 to	12.50
Short shoveling turnings...	12.00 to	12.50
Machine shop turnings....	8.00 to	8.50

Rolling Mill Grades:		
Iron rails	15.00 to	15.50
Rerolling rails	16.50 to	17.00

Cupola Grades:		
Steel rails less than 3 ft..	17.25 to	17.75
Steel rails less than 2 ft..	18.75 to	19.25
Angle bars, steel.....	16.50 to	17.00
Cast iron carwheels.....	14.00 to	14.50

Malleable Grades:		
Railroad	17.25 to	17.75
Agricultural	12.50 to	13.00

Miscellaneous:		
*Relaying rails, 56 to 60 lb.	23.00 to	25.00
*Relaying rails, 65 lb. and heav.	26.00 to	31.00

Per Net Ton

Rolling Mill Grades:		
Iron angles and splice bars	14.50 to	15.00
Iron arch bars and transoms	20.50 to	21.00
Iron car axles.....	26.50 to	27.00
Steel car axles.....	15.50 to	16.00
No. 1 railroad wrought...	13.25 to	13.75
No. 2 railroad wrought...	13.00 to	13.50
No. 1 busheling.....	11.50 to	12.00
No. 2 busheling.....	6.00 to	6.50
Locomotive tires, smooth..	13.25 to	13.75
Pipes and flues.....	9.50 to	10.00

Cupola Grades:		
No. 1 machinery cast....	15.75 to	16.25
No. 1 railroad cast.....	15.00 to	15.50
No. 1 agricultural cast....	14.50 to	15.00
Stove plate	12.25 to	12.75
Grate bars	12.50 to	13.00
Brake shoes	11.50 to	12.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Cold Rolled Strip.—Forward contracting has progressed steadily at 2.85c. to 2.95c. per lb., Cleveland. The freight rate to Chicago is 30c. per 100 lb. Specifications are lighter, and the industry as a whole is engaged between 65 and 75 per cent of capacity, contrasted with 80 to 85 per cent late in November.

Bars.—Soft steel bar mills are heavily engaged. Specifications are large, making it highly probable that deliveries will be pushed farther into the future. Farm implement manufacturers have been taking increasing quantities of steel and their bar requirements in 1928 have been about 50 per cent larger than in the previous year. Automobile parts makers are entering heavier specifications for delivery in the early weeks in January. Prices for soft steel bars are steady at 2c. to 2.10c. per lb., Chicago. The iron bar market is more active, as indicated by numerous small specifications for delivery in January. The alloy bar market remains steady, with some gains noted from automobile parts makers, who are producing in advance of an expected upturn in automobile output. Forward contracting in rail steel bars is practically complete at 1.95c. per lb., Chicago Heights. Users accustomed to prompt service from mills appear little concerned over deliveries after the start of the new year. Most sizes can be had in 10 days to two weeks.

Mill prices per lb.: Soft steel bars, 2c. to 2.10c., base, Chicago; common bar iron, 2c. to 2.10c., base, Chicago; rail steel bars, 1.95c., base, Chicago Heights mill.

Germany May Get Cartel Bonus for Low Production

WASHINGTON, Dec. 22.—It would appear that the membership of the German iron and steel industry in the International Steel Cartel has been of advantage in the recently terminated lockout in the Rhineland-Westphalia districts, according to a report received by the Department of Commerce from the trade commissioner in Berlin.

The report says:

"Another thought advanced in press discussion is that this cessation of production, which is almost sure to result in the total output of the German industry falling below the quota set by the cartel for the first time since its inauguration, may prove an actual benefit to the industry. This, it was anticipated, would result from the domestic industry being eligible to receive the \$2 per ton paid on all production not greater than 10 per cent below the quota set by the cartel, a circumstance which, with production the full 10 per cent below the quota, would make Germany eligible to receive approximately \$632,000 (2,500,000 marks) on the quarterly quota of 3,160,000 metric tons. Analysis, however, would appear to make this very unlikely, largely because production in Germany has, over the past three quarters, exceeded the allotted quota by approximately 600,000 tons per quarter."

New York

38,000 Tons of Plates Awarded for Wanaque Pipe Line— Pig Iron Shipments Heavy

NEW YORK, Dec. 24.—Shipments of pig iron are keeping up at a surprising rate. Melters apparently have virtually no inventories and are taking iron as fast as they are using it. In most instances, buyers have been specifying fully against their fourth quarter contracts, and there will be the smallest carryover to first quarter since the war. Blast furnace stocks are also low, in some cases consisting almost entirely of iron of odd analyses. Three furnaces in the Buffalo district, however, are expected to be lighted shortly. While foundry operations will suffer minimum interruption on account of the holidays, buying interest has been adversely affected. Sales in this district for the week totaled about 7000 tons. Little new inquiry appeared, but a revival in contracting is looked for early in January, since 25 to 30 per cent of the needs of melters for the first quarter is still to be placed, according to estimates by the trade. The General Electric Co. has closed against its first quarter inquiry for 5500 tons for Erie, Pa., and other Eastern plants. Purchases of several hundred tons each have been made against the recent inquiries of the New York Central and the Delaware, Lackawanna & Western railroads. Foundry iron continues to be available at \$17.50, base, Buffalo furnace, and \$19.50, base, eastern Pennsylvania furnace.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil.	1.75	
to 2.25		\$22.41 to \$22.91
*Buf. No. 2, del'd east.		
N. J.	20.78 to	21.28
East. Pa. No. 2 fdy., sil.		
1.75 to 2.25	20.89 to	22.52
East. Pa. No. 2X fdy., sil.		
2.25 to 2.75	21.39 to	23.02
East. Pa. No. 1X fdy., sil.		
2.75 to 3.25	21.89 to	23.52

Freight rates: \$4.91 from Buffalo, \$1.39 to \$2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of \$3.28 a ton from Buffalo.

Warehouse Business.—Orders have diminished as the holidays approached, but some jobbers report a few sizable tonnages in the past week. Demand for structural steel has slackened and sheet business is light. On both products occasional shading is noted, but is not widespread. As the early weeks of December have been active, resumption of good business is expected early in January.

Finished Steel.—If the present rate of new orders and specifications continues through the closing days of the month, December will be one of the most satisfactory months of the year. Prices on bars, shapes and plates have generally been adjusted to meet the quotations announced last week by the leading Eastern maker, and a minimum of 2c., Eastern basing

points, on plates and shapes and 1.90c., Pittsburgh, on bars, has been adhered to on first quarter business. Small tonnages are commanding prices \$1 to \$2 a ton higher. One of the largest plate tonnages placed recently in this district will be required by the Wanaque aqueduct for the North Jersey District Water Supply Commission. The project will require about 38,000 tons of steel plates, which is expected to be placed by T. A. Gillespie & Co., low bidder on the general contract, with the Steel Corporation subsidiary. Eastern mills will also benefit by recent freight car orders placed by Eastern and Southern roads, outstanding purchases having been 2500 by the Louisville & Nashville and 100 by the New York Central. The Delaware, Lackawanna & Western has ordered 10,000 tons of 130-lb. steel rails and track supplies. Sheet prices are firm at the new levels, namely, 2.85c., 3.60c. and 2.10c., Pittsburgh, for the black, galvanized and blue annealed grades, respectively, and most of the buyers in this district have contracted for first quarter requirements. Deliveries at the old prices are now being made only from material in stock at warehouses. The demand for standard steel pipe for building work has kept up at a good rate for this season of the year. Specifications for wire nails have been heavy on account of the advance in price, but the last week has seen a general clean-up of old business on makers' books.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.24c. to 2.34c.; plates, 2.17½c. to 2.27½c.; struc. shapes, 2.14½c. to 2.24½c.; bar iron, 2.14c. to 2.24c.

Cast Iron Pipe.—Northern and Southern makers of pressure pipe are maintaining prices quite firmly and are booking a moderate volume of tonnage from privately owned companies, which are placing their requirements in gas and water pipe for next year. The Federal Water Service Co., New York, has closed for several thousand tons of water pipe for its subsidiaries, and Stevens & Wood, New York, are expected to place 5000 tons or more of gas pipe before the end of the year. Yonkers, N. Y., has opened bids on about 200 tons of 6-in. water pipe, the second tonnage to be bought by this city in the past fortnight. Active municipal inquiry for pipe is not expected until about the middle of January.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, \$39.60 to \$41.60; 4-in. and 5-in., \$44.60 to \$46.60; 3-in., \$54.60 to \$56.60; Class A and gas pipe, \$4 to \$5 extra.

Reinforcing Bars.—The Turner Construction Co. has ordered 800 tons of reinforcing bars required for the Lackawanna terminal warehouse in Jersey City from the Jones & Laughlin Steel Corporation, but about 7500

tons is still to be bought. Lettings in the past week have been largely for small tonnages, but the volume of pending work is large, and considerable activity is expected after the first of the year. Prices are unchanged and, except in competition with foreign steel, are holding well.

Coke.—Better demand for both foundry and furnace coke is being re-

flected in firmer prices, but there has been no advance by makers. The foundry grade is being offered at \$3.50 to \$3.75 per net ton, Connellsville, and furnace coke at \$2.85 to \$3.05. By-product foundry coke is quoted at \$9 to \$9.40 per net ton, Newark or Jersey City, and \$10.06, New York or Brooklyn. Special brands of beehive coke are available at \$4.85, ovens, or \$8.56, delivered to northern New Jersey, Jersey City and Newark, and \$9.44, to New York and Brooklyn.

Old Material.—Iron and steel scrap prices have begun another upward movement, with No. 1 heavy melting steel quotable at an advance of 50c. per ton, delivered to eastern Pennsylvania consumers, based on two sizable purchases last week. A Coatesville user is understood to have bought a large tonnage of No. 1 steel at \$16.50 per ton, delivered, and a Claymont, Del., mill is reported to have paid \$16, the total of the two contracts being about 20,000 tons. Other grades of

scrap are strong, but buying prices of dealers do not yet show any advance.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel.	\$12.00 to \$12.50
Heavy melting steel (yard)	8.50 to 9.50
No. 1 hvy. breakable cast.	11.25 to 11.75
Stove plate (steel works)...	8.00 to 8.50
Locomotive grate bars....	8.50
Machine shop turnings....	7.25 to 7.50
Short shoveling turnings..	7.25 to 7.50
Cast borings (blast furn. or steel works).....	6.75 to 7.00
Mixed borings and turnings	6.75 to 7.00
Steel car axles.....	17.00 to 17.50
Iron car axles.....	24.00 to 24.50
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	8.00 to 8.50
No. 1 railroad wrought....	12.25 to 12.75
No. 1 yard wrot., long....	11.25 to 11.75
Rails for rolling.....	13.00 to 13.50
Cast iron carwheels.....	12.00 to 12.50
Stove plate (foundry)....	9.50
Malleable cast (railroad)...	10.00 to 10.50
Cast borings (chemical)...	11.25

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	\$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

for pig iron from that source will be heavy for the first quarter.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	\$19.50
S'th'n fdy., sil. 1.75 to 2.25, \$22.50 to	23.00
Malleable	19.50
Ohio silvery, 8 per cent....	29.00
Basic Valley furnace.....	17.50
Stand. low phos., Valley..	26.50 to 27.00

Prices, except on basic and low phosphorus, are delivered Cleveland. Freight rates: 50c. from local furnaces; \$3 from Jackson, Ohio; \$6 from Birmingham.

Iron Ore.—Lake furnaces consumed 4,897,404 tons of ore in November, a decrease of 127,238 tons from October. The amount consumed in November, last year, was 3,813,637 tons. Ore at furnaces Dec. 1 amounted to 33,625,980 tons, and the total amount at furnaces and Lake Erie docks on that date was 40,080,106 tons, compared with 41,471,704 tons on the same date a year ago. Central district furnaces consumed 2,590,851 tons of ore in November, a decrease of 90,499 tons for the month. Lake front furnaces used 2,121,977 tons, a decrease of 39,800 tons, and all-rail furnaces consumed 92,783 tons, a decrease of 1932 tons. Eastern furnaces used 91,793 tons, a gain of 4993 tons. On Nov. 30 there were 167 furnaces using Lake ore in blast, a decrease of two for the month.

Old Material.—A Cleveland mill has bought several thousand tons of high grade No. 1 heavy melting steel at \$17, which is about the same price that has prevailed for some time for the quality of scrap specified. The most of this will be shipped in January. While other mills have not come into the market for scrap for delivery after the first of the year, considerable buying is expected early in the month. The market is very firm, and the recent price advance is not bringing out steel making scrap in excess of the supply. Blast furnace scrap is not moving quite as well as steel making grades. The only price change is a 25c. a ton advance in machine shop turnings.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	\$14.75 to \$15.25
No. 2 heavy melting steel.	14.25 to 14.75

Coke.—The price of Ohio by-product foundry coke has been reestablished at \$7.75, Painesville, for January shipments. Specifications have slowed

Cleveland

Steel Orders and Specifications for December Will Exceed Those in November—Sheet Mills Well Engaged

CLEVELAND, Dec. 24.—Specifications for steel bars, plates and shapes kept up in very satisfactory volume the past week, and most of the tonnage covered by last quarter contracts was ordered out. This steel will be shipped at the convenience of the mills and little of it will be delivered before January. Some specifications have also been issued against first quarter contracts. The tonnage entered by several of the mills during December will run over that of November. There was considerable additional contracting during the week, and most consumers are now covered for the first quarter. Forge shops are placing round lots of steel bars either in specifications or contracts and expect that their plants will be filled with orders from the automotive industry for the first quarter.

Automobile manufacturers have issued liberal specifications for alloy steel and auto body sheets for January shipment, but as yet have not come out with heavy specifications for other products. Evidently this industry has enough material on order to carry it well through January. Many of the motor car builders are now operating at reduced schedules, but will increase production after the first of the month.

Structural activity took quite a spurt the past week. The outstanding award was 7000 tons for a dirigible hangar for the Goodyear-Zeppelin Co., Akron. The market is holding firm at the regular prices of 1.90c.

Pig Iron.—Buying has continued in good volume for the holiday season, Cleveland interests having sold 15,000 tons during the week in foundry and malleable grades. The business was nearly all for the first quarter, as consumers are showing very little interest in contracts for iron for delivery beyond April 1. Prices are holding at recent quotations. For out of town shipment, Cleveland furnaces are getting \$18.50 for foundry and malleable iron and another Lake furnace interest is holding to \$19.50 for eastern Ohio and Indiana shipment. The Michigan market is unchanged at \$20. While some foundries have held up shipments during the past week or two, the amount suspended because of the approaching inventory time is less than usual, and several of the furnaces welcome a slowing down in demand in order that they can accumulate iron in their stocks, which are now very low. The large production program announced by the automotive industry for the early part of next year indicates that the demand

down somewhat because of the approaching inventory time and new business is light.

Sheets.—Mills received considerable business the past week in specifications against old contracts and some orders to apply on first quarter contracts. They now have enough tonnage on their books to keep them busy through the first half of January or longer. Some have made contract obligations that will keep them well filled through the first quarter. The automotive industry has not yet specified very much tonnage on first

quarter contracts. The market is firm at regular quotations.

Strip Steel.—Releases to mills of specifications for hot-rolled flats are rather light, but mills are still comfortably filled with orders. Some large consumers have not yet made first quarter commitments. Prices are holding within the range quoted, and makers are adhering to the new card of extras. Cold-rolled strip is also moving rather slowly. The market is being well maintained at the regular 2.85c., Cleveland, price.

Philadelphia

Plate and Shape Contracts Revised to New Levels— Heavy Melting Steel Up \$1 Per Ton

PHILADELPHIA, Dec. 24.—Some contracts for first quarter delivery of plates and shapes have been adjusted to the recently announced minimum of 2c. per lb., Coatesville, on plates and 2c., mill, on shapes. Small buyers are being asked to pay a minimum of 2.05c., mill. Although plate prices are firm at the new level, 2c., mill, on shapes is occasionally shaded on desirable tonnages. Sheet prices are firm, but the volume of new contracting has been small.

As a result of two sizable scrap purchases in the past week, No. 1 heavy melting steel shows an advance of \$1 a ton.

Pig Iron.—Although steel company furnaces are still adhering to \$21 per ton for first quarter tonnage, there is a tendency among merchant furnaces to consider desirable business on the basis of \$20.50, the quotation for December delivery. Many foundries are covered for part of the coming quarter, and, with no price advance in prospect, are not inclined to hasten in anticipating their needs farther ahead. Domestic low phosphorus prices are unchanged at \$23 to \$23.50 per ton, f.o.b. eastern Pennsylvania furnace, but British low phosphorus iron is reported to be obtainable at about \$22.50 per ton, duty paid, Philadelphia. Consumers are using up iron rapidly and are frequently pressing for deliveries.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	21.26 to 21.76
East. Pa. No. 2X, 2.25 to 2.75 sil.	21.76 to 22.26
East. Pa. No. 1X, 2.25 to 2.75 sil.	22.26 to 22.76
Basic (del'd east. Pa.)	19.75 to 20.25
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'rg low phos. (f.o.b. furnace)	23.00 to 23.50
Va. No. 2 plain, 1.75 to 2.25 sil.	25.29
Va. No. 2X, 2.25 to 2.75 sil.	25.79

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to \$1.64 from eastern Pennsylvania furnaces; \$4.54 from Virginia furnaces.

Bars.—A substantial tonnage of bars is under contract for the first quarter at 1.90c. to 1.95c. per lb., Pittsburgh, or 2.22c. to 2.27c., delivered Philadelphia. A number of bar users, however, have not yet renewed contracts, foreseeing no early advance in prices and preferring to buy as their needs arise. Some sizable reinforcing bar tonnages are in the market, including about 1000 tons for an Internal Revenue Bureau building in Washington and about 800 tons for a bridge in Baltimore.

Plates.—Eastern Pennsylvania mills

are adjusting contracts to the new minimum of 2c., Coatesville, or 2.10c., Philadelphia. When the tonnage involved is small, the mills insist on a minimum of 2.05c., Coatesville. Prices range from 2c. to 2.05c., Coatesville, or 2.10c. to 2.15c., Philadelphia, with occasional less-carload lots bringing 2.10c., Coatesville.

Shapes.—Contracts at 2.05c., f.o.b. nearest mill to consumer, have been adjusted to the new level of 2c., mill, or 2.06c., delivered Philadelphia, but the market is not entirely firm at the new level, and 2c., mill, is sometimes subject to concession when a desirable tonnage is offered. Several large fabricated projects are in the market, including a building in Washington for the Internal Revenue Bureau, requiring about 10,000 tons, a bridge in Baltimore, calling for 32,000 tons, and a new dormitory at the University of Pennsylvania.

Warehouse Prices, f.o.b. Philadelphia

Base per Lb.

*For 50 bundles or more; 10 to 49 bun., 4.10c. base; 1 to 9 bun., 4.35c. base.
†For 50 bundles or more; 10 to 49 bun., 4.95c. base; 1 to 9 bun., 5.30c. base.

Warehouse Business.—Orders for shipment from stock continue in good volume, despite the holidays, and the total for the month is expected by most jobbers to compare favorably with that of November.

Sheets.—A moderate number of first quarter contracts have been closed on blue annealed sheets at 2.10c., Pittsburgh, or 2.42c., Philadelphia. In some cases, where competition for narrow sheet business is encountered from continuous sheet mills, 2c., Pittsburgh, has prevailed. Black and galvanized sheet prices are reported quite firm at 2.85c., Pittsburgh, or 3.17c., Philadelphia, for black and 3.60c., Pittsburgh, or 3.92c., Philadelphia, for galvanized. However, contracting has not yet been extensive, and, with many consumers of galvanized sheets covered on old lower-priced contracts until mid-January, a test of present quotations is delayed.

Imports.—In the week ended Dec. 22, 3867 tons of pig iron arrived at this port, of which 3539 tons was from British India and 328 tons from Norway. Ore imports consisted of 750 tons of chrome ore from British India and 502 tons of manganese ore from Java. Steel imports were small, with 74 tons of structural shapes from Belgium and 66 tons from Germany and 55 tons of steel bars and 30 tons of billets from Sweden. Scrap imports consisted of four tons from Germany.

Old Material.—All grades of scrap show a strong undertone. No. 1 heavy melting steel has advanced \$1 a ton on purchases totaling between 15,000 and 20,000 tons by consumers at Coatesville, Pa., and Claymont, Del. The consumer at Claymont closed about a fortnight ago on several thousand tons at \$15.50 per ton and last week bought upward of 6000 tons at \$16, delivered. The Coatesville buyer also bought recently at \$15.50 per ton and in the past week paid \$16.50 per ton, delivered. Other grades of scrap are not so active as heavy melting steel, but in some instances have registered advances in price of 50c. a ton, based on small purchases.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	\$16.00 to \$16.50
Scrap T rails	15.50 to 16.00
No. 2 heavy melting steel	12.50
No. 1 railroad wrought (for steel works)	16.00 to 16.50
Bundled sheets (for steel works)	11.00
Machine shop turnings (for steel works)	11.00 to 11.50
Heavy axle turnings (or equiv.)	12.50 to 13.00
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	15.50 to 16.00
Railroad grate bars	12.50
Stove plate (for steel works)	12.50
No. 1 low phos., hvy., 0.04% and under	19.00 to 20.00
Couplers and knuckles	17.50 to 18.00
Rolled steel wheels	17.00 to 17.50
No. 1 blast f'nace scrap	10.00 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	18.50 to 19.00
Steel axles	21.50 to 22.00
No. 1 forge fire	12.00 to 12.50
Cast iron carwheels	16.50
No. 1 cast	16.25 to 16.75
Cast borings (for chem. plant)	15.00
Steel rails for rolling	16.50 to 17.00

Fabricated Structural Steel

Bridge at Baltimore Will Take 32,000 Tons—18,500 Tons Awarded for Chicago Board of Trade Building

WITH the Chicago Board of Trade Building requiring 18,500 tons, structural steel awards during the week amounted to 44,800 tons. Other large tonnages placed were 7000 tons for an airship hangar at Akron, Ohio, and 5700 tons for Reading Railroad bridge work. Outstanding in the new work out for bids is a bridge at Baltimore, which will take 32,000 tons of the 44,000 tons reported pending. Awards follow:

BOSTON & MAINE RAILROAD, 2200 tons, five bridges, to Phoenix Bridge Co.

ANDOVER, MASS., 140 tons, dining hall, to New England Structural Co.

NEW YORK, 300 tons, building in East Eighty-eighth Street for Edward Corning, to American Bridge Co.

STATE OF NEW YORK, 150 tons, highway bridge, to American Bridge Co.

ORANGE, N. J., 800 tons, Orange Memorial Hospital, to Hinkle Steel Construction Co.

READING RAILROAD, 5700 tons, bridge work, to Phoenix Bridge Co.

BALTIMORE & OHIO RAILROAD, 250 tons, bridges, to Bethlehem Steel Co.

BEAVER FALLS, PA., 155 tons, Farmers Bank Building, to Fort Pitt Bridge Works.

MOBILE, ALA., 1155 tons, office building for Merchant Securities Co., to Virginia Bridge & Iron Co.

LOUISVILLE, KY., 1700 tons, approaches to Louisville bridge over Ohio River, to American Bridge Co.

AKRON, OHIO, 7000 tons, hangar for Goodyear Zeppelin Co., to American Bridge Co.

CHICAGO, 18,500 tons, Board of Trade Building, to American Bridge Co.

CHICAGO, 200 tons, salesroom for Studebaker Corporation, to Wendnagel & Co., local.

ST. LOUIS, 3000 tons, apartment house at Kings Highway and Maryland Avenue, to Mississippi Valley Structural Steel Co.

ST. LOUIS, 750 tons, open-hearth building for Laclede Steel Co., to Mississippi Valley Structural Steel Co.

KANSAS CITY & GRAND VIEW RAILROAD, 1100 tons, bridges, to Kansas City Structural Steel Co.

LOUISVILLE & NASHVILLE RAILROAD, 800 tons, bridges, to Nashville Bridge Co.

SAN FRANCISCO, 180 tons, gymnasium on Frederick Street, to Dyer Brothers.

SAN FRANCISCO, 146 tons, apartment building, Golden Gate Avenue and Steiner Street, to McClintic-Marshall Co.

EUGENE, ORE., 375 tons plates, three roller type dam gates for Leaburg project, to Willamette Iron & Steel Works.

PORTLAND, ORE., 180 tons plates, sulphite digesters for Oregon plant, to Willamette Iron & Steel Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

NEW YORK, 800 tons, Miss Spence's School in East Ninety-first Street.

STATE OF NEW JERSEY, 1400 tons, three highway bridges in Morris County.

BALTIMORE, 32,000 tons, bridge over arm of Chesapeake Bay.

WASHINGTON, unnamed tonnage, six buildings and alterations at Army

Medical Center; bids taken by Construction Service Quartermaster.

PHILADELPHIA 100 tons, dormitory at Hamilton Walk and Thirty-sixth Street for University of Pennsylvania.

PHILADELPHIA, 6000 tons, grade crossing elimination at Manayunk for Reading Co.; Phoenix Bridge Co., low bidder.

ROME, N. Y., 550 tons, building for Rome Wire Works.

BUFFALO, 150 tons, dock shed for Cleveland-Buffalo Transit Co.

BUFFALO, 1000 tons, Burgard Vocational School.

DELAWARE, LACKAWANNA & WESTERN RAILROAD, 450 tons, freight house at Buffalo.

CLEVELAND, 140 tons, building for Continental Lithograph Corporation.

CLEVELAND, 400 tons, Quincy Avenue bridge for Nickel Plate railroad.

CHICAGO, 1500 tons, building for Illinois Bell Telephone Co.

SPRINGFIELD, ILL., 500 tons, building for Monarch tractor division of Allis-Chalmers Mfg. Co.

MINNEAPOLIS, 4500 tons, Northern National Bank Building.

SOUTH CHICAGO, ILL., 530 tons, ore building for Mead Morrison Mfg. Co., Chicago.

SAN FRANCISCO, 155 tons, apartment building at Vallejo and Octavia Streets: bids being taken.

HELENA, MONT., 661 tons, Missouri River bridge; bids opened.

Standardizing Drawings and Drafting Room Practice

Considerable progress has been made by the sectional committee on the standardization of drawings and drawing room practice, which is sponsored by the American Society of Mechanical Engineers and the Society for the Promotion of Engineering Education.

Subcommittee No. 2, on method of indicating dimensions, met Dec. 5 and discussed a proposal which had been drafted by its chairman, E. B. Neil, manager of the research department *Automotive Industries*, Philadelphia, after careful study of the practices of a large number of industrial plants. A chart indicating proposed standard arrangement and view of mechanical drawings which employ the third angle of projection, submitted by subcommittee No. 4, on layout, has met with unanimous approval. F. G. Wolff, assistant to the general mechanical engineer American Car & Foundry Co., is chairman of the committee. Replies to a questionnaire sent to 878 firms are being

summarized by subcommittee No. 3, on lettering, which is headed by T. G. Crawford, supervisor of drafting, General Electric Co. Subcommittee No. 5, on line work, which has submitted three proposals, will issue a revised report shortly. Samuel Ketchum, engineer M. H. Treadwell Co., New York, is chairman.

Proposals for graphical symbols on drawings have been distributed by subcommittee No. 6, which is headed by G. H. Drake, chairman of the standardization committee of the National Association of Master Plumbers. Copies of the proposal are now being considered by the American Institute of Architects. Work of this committee also includes a series of graphical symbols proposed by the American Society of Heating and Ventilating Engineers.

Automobile Production Will Be a Record

NEW YORK, Dec. 24.—*Automotive Industries* this week will say:

"With a production of approximately 300,000 in December indicated by operations in car and truck factories, the total production for the industry in 1928 will be brought to about 4,650,000, an increase of about 150,000 over the former record total set up in 1926. Production for the industry in 1927 totaled 3,580,000, more than a million lower than in the present year.

"Operations in the closing week of the year will be reduced by the holidays, but only a few will be closed for inventories or other late year purposes. In many plants, work will actually be speeding up on new models, which have been sold ahead for varying periods in 1929. Ford dealers, though running into a slow delivery period in December, still have orders many weeks ahead, and Chevrolet and Willys-Overland dealers have built up large order books at their December showings."

Production of Files \$12,973,- 734 in 1927

WASHINGTON, Dec. 24.—The production of files by 36 establishments engaged primarily in that line represented a value of \$12,973,734 in 1927, a decrease of 4.2 per cent reported by 38 establishments in 1925 with a value of \$13,540,953, according to the Bureau of the Census. The 1927 values by types were as follows: Files and rasps, metalworking, \$11,854,620; woodworking, \$95,743; other files, \$396,166; other products and amount received for repair work, \$627,205. Of the establishments reporting for last year, seven were located in New Jersey, seven in Pennsylvania, five in New York, five in Ohio, three in Rhode Island, two in Connecticut, two in Illinois, two in Indiana, one in Iowa, one in Massachusetts and one in Michigan.

Boston

Pig Iron Sales Drop to Low Point—Finished Steel Business Good for Time of Year

BOSTON, Dec. 24.—Pig iron sales in this territory during the past week dropped to a minimum. Some of the Buffalo district furnaces reported larger bookings, but individual sales were in small tonnages and failed to bring the week's business up to the previous week's level. A fair amount of Indian iron also was sold. Buffalo iron is still offered at \$17.50 a ton, furnace, for No. 2 plain, and \$18 for No. 2X, while all sales of No. 1X reported were at \$19, instead of \$19.50, as openly quoted. Indications are the Mystic Iron Works' December sales will total 25,000 tons. In that event December will be the second largest month for sales in the history of the stack.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25..	\$22.41 to \$22.91
*Buffalo, sil. 2.25 to 2.75..	22.91 to 23.41
East. Penn., sil. 1.75 to 2.25.	24.15 to 24.65
East. Penn., sil. 2.25 to 2.75.	24.65 to 25.15
Va., sil. 1.75 to 2.25.....	26.91
Va., sil. 2.25 to 2.75.....	27.41
Ala., sil. 1.75 to 2.25.....	23.41 to 25.77
Ala., sil. 2.25 to 2.75.....	23.91 to 26.27

Freight rates: \$4.91 all rail from Buffalo; \$3.65 from eastern Pennsylvania; \$5.21 all rail from Virginia; \$6.91 to \$8.77 from Alabama.

*All rail rate.

Coke.—Specifications against 1928 by-product foundry coke contracts are exceptionally heavy for late December. Foundries are busier than they were a year ago. Specifications also have been made for early January shipments. New England producers quote such fuel at \$11 a ton, delivered within a \$3.10 freight rate zone, unchanged from a month ago, but 50c. a ton less than a year ago. Domestic by-product coke is in good demand and ovens are pushed to the limit to keep up with orders.

Cold-punched nuts.....	50 and 5
Stove bolts	70 and 10

*Including quantity differentials.

Finished Material.—Sales of finished material in general by the leading steel mills so far in December have run approximately 12 to 15 per cent ahead of those for November, and considerably more than that ahead of December last year. November sales in some instances were the best for any one month this year.

Old Material.—A marked slump in shipments of old material out of New England occurred in the past week. Brokers say there is nothing significant in the slump, and that it usually comes just before the close of a year. There have been no changes in prices. Further activity in the export market is expected after Jan. 1. Exporters have experienced difficulty in securing shipping space. Wire, rails,

poles and other street railway equipment, representing an investment of \$2,060,718, have been sold by the Springfield Street Railway and the Worcester Consolidated Street Railway to the New England Allite Corporation, Worcester, Mass.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel.....	\$11.00 to \$11.50

Railroad malleable	15.50 to 15.75

St. Louis

Missouri Pacific Orders 55,800 Tons of Rails—3000 Tons of Steel Awarded for Apartment House

ST. LOUIS, Dec. 24.—Holiday dullness has affected the pig iron market, and sales were very light in the past week. Sales of the St. Louis Gas & Coke Corporation totaled only 1050 tons; the largest order was for 250 tons for an Illinois stove foundry. All sales were for first quarter. Two East Side melters are negotiating for a total of 1500 to 2000 tons, which will be closed this week. Shipments of the Granite City maker for December are expected to be about 40,000 tons ahead of those of the same month last year. Stove makers in the district have closed down for inventory and repairs over the holidays, but jobbing foundries will be down probably only for Christmas day. The market continues firm at unchanged prices.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b.	
Granite City, Ill.....	\$20.00
Malleable, f.o.b. Granite City.....	20.50
N'th'n No. 2 fdy., deliv'd St. Louis..	22.16
Southern No. 2 fdy., deliv'd.....	20.92
Northern malleable, deliv'd.....	22.16
Northern basic, deliv'd.....	22.16

Freight rates: 81c. (average) Granite City to St. Louis; \$2.16 from Chicago; \$4.42 from Birmingham.

Coke.—Domestic coke is moving in large volume as a result of the colder weather, and the Granite City by-product concern has been able to materially reduce its piles. Heavy melt has caused a greater consumption of foundry coke.

Rails and Track Supplies.—The Missouri Pacific, including the International-Great Northern, has purchased 55,800 tons of 90 and 110-lb. rails; 151,000 pairs of angle bars and 24,000 kegs of track spikes and bolts. The rails were divided among the Illinois Steel Co., Inland Steel Co.,

Colorado Fuel & Iron Co., Tennessee Coal, Iron & Railroad Co. and Bethlehem Steel Co. These companies and the Sheffield Steel Co., Scullin Steel Co. and Railroad Supply Co. will furnish the track supplies, according to an announcement of the purchasing department.

Finished Iron and Steel.—The most important transaction of the week was the award to the Mississippi Valley Structural Steel Co. of 3000 tons for an apartment house at Kingshighway and Maryland Avenue. The Illinois Highway Commission opened bids this week for highway paving and bridge work that will require about 2250 tons of reinforcing bars. Specifications for sheets and plates have been received in satisfactory volume by the Granite City Steel Co. Warehouse business has been falling off steadily since Dec. 15.

Old Material.—The market for old materials was quiet during the past week, and only a few sales of items needed for fill-in purposes were made. However, the market is strong, in expectation of a heavy buying movement which is expected to develop soon. Railroad lists: Chicago & Eastern Illinois, 800 steel underframe gondola cars; Great Northern, 2500 wheels; and Frisco lines, 37 carloads.

Dealers' buying prices, per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	\$13.25 to \$13.75
No. 2 heavy melting or shoveling steel	12.50 to 13.00

No. 1 railroad cast	14.00 to 14.50
Stove plate	12.50 to 13.00
Agricult. malleable	11.50 to 12.00
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Canada

Structural Steel Leads in Market Activity

TORONTO, ONT., Dec. 24.—While there has been a slight curtailment of spot pig iron buying, general business in this market continues active. A considerable number of orders have been taken for first quarter delivery. About 60 per cent of the contract buyers have covered first quarter needs. Canadian pig iron prices have not changed during the week; sales are being made at \$23.60, Toronto, for No. 1 foundry iron, and at \$25 to \$25.50 in the Montreal district.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	\$23.60
No. 2 fdy., sil. 1.75 to 2.25	23.60
Malleable	23.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	25.00
No. 2 fdy., sil. 1.75 to 2.25	25.00
Malleable	25.00
Basic	24.00
Imported Iron, Montreal Warehouse	
Summerlee	33.50
Carron	33.00

Structural Steel.—As a result of the record building year in Canada, several structural steel fabricators have made extensive enlargements to plants to cope with the demand. Business has fallen off in the past week, but prospects are good. In eastern Canada, Toronto heads the list in projected building; pending jobs include

1200 tons for new building on St. Joseph Street, Toronto, for St. Michael's College; 1200 tons for new automobile building at the Canadian National Exhibition, Toronto; 1200 tons for an office building on Richmond Street, and 5000 tons for a 20-story hotel on York Street, Toronto; 2500 tons for building for Victoria College, Toronto; 250 tons for factory for Rogers Batteryless Radio Co, on Fleet Street, Toronto; 125 tons for addition to plant of General Steel Wares, Ltd., London, Ont.; 250 tons for factory at Cap de la Madeleine, Que., for Claude Denis & Co.; 600 tons for addition to Empress Hotel at Victoria, B. C., for the Canadian Pacific Railway.

Old Material.—Prices in the Toron-

to and Montreal markets show no change for the last week of the year.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel	\$9.50	\$7.00 to \$7.50
Rails, scrap	10.00	9.00
No. 1 wrought	9.00	11.00 to 11.50
Machine shop turnings	7.00	5.00
Boiler plate	7.00	6.00
Heavy axle turnings	7.50	6.50
Cast borings	7.50	5.00
Steel turnings	7.00	5.50
Wrought pipe	5.00	5.00
Steel axles	14.00	20.00
Axles, wrought iron	16.00	22.00
No. 1 machinery cast	16.00 to	17.00
Stove plate	13.00	13.00
Standard carwheels	16.00	16.00
Malleable	13.00	13.00
Per Net Ton		
No. 1 machinery cast	15.00	
Stove plate	9.00	
Standard carwheels	13.00	
Malleable scrap	13.00	

Birmingham

Many Plants to Be Shut Down for Five-Day Holiday Period —First Quarter Outlook Good

BIRMINGHAM, Dec. 24.—The only new pig iron business during the past week was a few small-lot sales. First quarter iron is more nearly covered than it has been for any like period in several seasons. Shipments are lighter as plants prepare to shut down for the holiday period. Prices are unchanged; one company quotes \$17 and the others \$16.50. There have been no changes in furnaces in blast; eight are on foundry, nine on basic, one on ferromanganese and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil. ..	\$16.50 to \$17.00
No. 1 fdy., 2.25 to 2.75 sil. ..	17.00 to 17.50
Basic	16.50

Finished Steel.—New business and inquiries have held up remarkably well during a period that has nearly always been dull. Prospective business is reported by sales officials to be very good. Shipments dropped considerably during the past week. Major operations in the district are to be closed down for a five-day period beginning Dec. 22. Structural steel fabricators report more business on books than in several months. The Virginia Bridge & Iron Co. has booked 1155 tons for an office building at Mobile. On Dec. 19 this company shipped 32 carloads for the American Enka Corporation at Asheville, N. C. Reinforcing bar manufacturers have had a good week. New orders received by the Connors Steel Co. include 180 tons for a warehouse at Birmingham and 175 tons for a gymnasium at New Orleans. During the past week the Tennessee company operated seven and eight open-hearth at Ensley and seven at Fairfield. The Gulf States Steel Co. continues to work four at Alabama City.

Cast Iron Pipe.—The market has been passive during the past week in new business. Prospective business for the first quarter is becoming more encouraging as public utility and mu-

nicipal requirements are made known. Good tonnages are in prospect from Detroit and Milwaukee. Feelers from public utilities indicate that several tonnages ranging from 15,000 to 50,000 tons will be up for figures in the near future. Most of the plants in the district will be closed down from a week to 10 days during the holiday period. Makers are maintaining quotations of \$37 to \$38 on 6 in. and larger sizes.

Coke.—Buying has slackened, and new business is expected to be small until after the holidays.

Old Material.—Only a small amount of buying is being done. Inquiries are light and the condition of the market has changed very little. Dealers look for an active market after the holidays.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	\$12.50
Scrap steel rails	\$12.00 to 12.50
Short shoveling turnings ..	8.00 to 8.50
Cast iron borings	8.00
Stove plate	13.50
Steel axles	19.00 to 20.00
Iron axles	21.00 to 22.00
No. 1 railroad wrought....	10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	15.00
Tramcar wheels	13.00 to 14.00
Cast iron carwheels	13.00 to 13.50
Cast iron borings, chem....	13.50 to 14.00

Directors of the Laclede Steel Co., St. Louis, have declared a 50 per cent stock dividend to be submitted to stockholders on Feb. 28. Under the plan the present capitalization will be increased from \$2,750,000 to \$4,125,000, and stockholders will receive one new share for each two shares now held. It also is intended to lower the par value of the stock from \$100 to \$20, and issue five new shares for each share now held, which would give stockholders 7½ shares for each share now held. In 1928, the stock paid cash dividends of \$15 a share.

Pacific Coast

Cast Iron Pipe Leads in Week's Business—Most Lines Suffering from Year-End Dullness

SAN FRANCISCO, Dec. 22 (*By Air Mail*).—Bookings of iron and steel products on the Coast during the past week consisted mostly of cast iron pipe tonnages, of which a fair aggregate was placed. Outstanding was 1350 tons for a street improvement project in Los Angeles, awarded to the American Cast Iron Pipe Co. Mill representatives look for little new steel business until after the first of the year. The price situation is fairly firm in most lines, with the exception of out-of-stock quotations on reinforcing steel bars in Los Angeles and San Francisco.

Building permits issued in Los Angeles up to and including Dec. 12 numbered 1058, with an estimated valuation of \$2,802,266, compared with 1052 permits and a valuation of \$2,673,711 for the corresponding period in December, last year. So far this year, \$94,448,713 in permits has been issued, compared with \$118,978,201 for the same period in 1927.

Pig Iron.—Trading in foundry pig iron is limited to unimportant lots. Little improvement is noted in the rate of operations among the jobbing plants. Prices continue unchanged.

Prices per gross ton at San Francisco:

*Utah basic		\$25.00 to \$26.00
*Utah fdy., sil.	2.75 to	
3.25		25.00 to 26.00
**Indian fdy., sil.	2.75 to	
3.25		24.00 to 25.00

*Delivered San Francisco.

**Duty paid, f.o.b. cars San Francisco.

Bars.—Reinforcing steel bar awards, with two exceptions, were confined to lots of less than 100 tons. The Northwest Steel Rolling Mills took 200 tons for highway work for the State at Olympia, Wash. An apartment in Los Angeles calling for 200 tons was placed with an unnamed interest. No new inquiries of importance came up during the week. Bids have been opened on 276 tons for highway work in Imperial County, Cal., and on 121 tons for the Missouri River bridge at Helena, Mont. Prices on mild steel bars continue firm at 2.30c., c.i.f. Coast ports, while out-of-stock quotations of reinforcing bars in Los Angeles and San Francisco continue weak at 1.80c., base.

Plates.—From present indications, plate awards during 1928 will fall considerably below the aggregate booked last year. The Willamette

Iron & Steel Works took 375 tons for three roller type dam gates for the Leaburg project at Eugene, Ore., and 180 tons for sulphite digesters for an Oregon plant. Bids were opened this week on 250 tons for a steel storage tank for the Marin Municipal Water District at San Rafael, Cal. Prices are firm at 2.25c. c.i.f.

Shapes.—Although fabricators are fairly busy figuring on new work, awards this week were by no means heavy. Dyer Brothers secured 180 tons for a gymnasium in San Francisco and McClintic-Marshall Co. took 146 tons for an apartment in San Francisco. Bids were opened this week on 661 tons for the Missouri River bridge at Helena, Mont. Plain material continues firm at 2.35c., c.i.f. Coast ports.

Cincinnati

Coke and Scrap Prices Higher—Sheet Mills Well Occupied With Releases for January Shipment

CINCINNATI, Dec. 24.—The past week has been the duller of the year in the pig iron market. Scattered sales of small lots of Northern foundry iron totaled less than 2000 tons, and there are no pending inquiries of consequence before the trade. The price situation remains unchanged. One Alabama furnace is asking \$17, base Birmingham, but all other Southern producers are taking business at \$16.50. Southern Ohio foundry iron is quoted nominally at \$18.50 to \$19, base Ironton. Indications are that consumers will not resume buying on an appreciable scale until about the middle of January.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil.	1.75 to	
2.25		\$20.39 to \$20.89
Ala. fdy., sil.	1.75 to 2.25	20.19 to 20.69
Ala. fdy., sil.	2.25 to 2.75	20.69 to 21.19
Tenn. fdy., sil.	1.75 to 2.25	20.19
S'th'n Ohio silvery, 8 per cent		27.89 to 28.89

Freight rates, \$1.89 from Ironton and Jackson, Ohio; \$3.69 from Birmingham.

Finished Material.—District sheet manufacturers report that bookings this month have exceeded production by a comfortable margin, so that unfilled tonnage is at the highest point in several months. Maintenance of the present operating schedules well into January is assured. Automobile companies working on new models are beginning to ask for body stock, and in some cases orders for rush delivery have been placed. Prices are showing strength, with blue annealed at 2.10c., base Pittsburgh, black at 2.85c., galvanized at 3.60c., and automobile body sheets at 4.10c. The fact that quotations on bars, shapes and plates are not changed for first quarter has

Cast Iron Pipe.—Cast iron pipe representatives are keenly interested in the inquiry put out by Portland for 3135 tons, bids on which are to be opened Dec.*28. Alternate bids are being taken on Class B and sand cast pipe, the sizes ranging from 4 to 20 in. The American Cast Iron Pipe Co. booked 1350 tons of 2 to 10-in. Class B pipe for Lomita District No. 13, Los Angeles. The Pacific States Cast Iron Pipe Co. secured 250 tons of 4 and 8-in. Class 150 pipe for the East Bay Water Co., Oakland, 100 tons of 4 to 8-in. Class 150 pipe for Patterson, Cal., and 150 tons of 6 and 8-in. Class 150 for Riverside, Cal. Friday Harbor, Wash., placed 292 tons of 4 to 8-in. Class C pipe with the United States Cast Iron Pipe & Foundry Co., Burbank, Cal., awarded 66 tons of 4 and 6-in. Class B and 260 tons of 4 to 8-in. Class 250 pipe to the Pacific States Cast Iron Pipe Co. and the American Cast Iron Pipe Co., respectively. Bids have been opened on 324 tons of 6-in. Classes B and C pipe for San Diego.

taken away any price incentive which might lead to heavy specifications during the last few weeks of the year. Consequently, these products are quiet, but are steady at 1.90c. to 2c., base Pittsburgh. Rail steel reinforcing bars are quoted by a local maker at 1.90c. to 1.95c., base mill. The wire goods market is sluggish. Manufacturers are asking \$2.65 per keg, base Ironton, for common wire nails.

Coke.—By-product domestic coke for shipment to Cincinnati from district ovens will go up 50c. a ton Jan. 1, the new delivered prices being \$5.50 on walnut, \$5 on No. 2 nut and \$6.50 on egg. The schedule in Indiana will remain at the present level of \$4 on walnut, \$3.50 on No. 2 nut and \$5 on egg. At Detroit, by-product domestic egg advanced 50c. a

ton to \$6.50, ovens, on Dec. 20. However, shipments for the remainder of the month specified previous to that time are being made at the old price. By-product foundry coke in this district is firm and unchanged at \$7, ovens, or \$9.14, delivered Cincinnati. Wise County beehive foundry coke is quoted at \$4.50 to \$5.25, ovens, and New River beehive foundry at from \$6.50 to \$7, ovens.

Old Material.—For the second consecutive week, heavy melting steel has advanced in price, while scrap rails, sheet clippings, bundled sheets and railroad wrought also have advanced from 25c. to 50c. a ton. District steel plants are accepting a moderate amount of scrap on current contracts, but fresh buying has been negligible. The growing strength of

prices is based largely on an anticipated increased demand for scrap during January and February rather than on the present rate of consumption.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel.....	\$13.75 to \$14.25
Scrap rails for melting.....	13.50 to 14.00
Loose sheet clippings.....	9.75 to 10.25
Bundled sheets	10.50 to 11.00
Cast iron borings.....	9.75 to 10.25
Machine shop turnings.....	9.00 to 9.50
No. 1 busheling.....	11.00 to 11.50
No. 2 busheling.....	7.00 to 7.50
Rails for rolling	14.00 to 14.50
No. 1 locomotive tires.....	14.00 to 14.50
No. 2 railroad wrought....	13.75 to 14.25
Short rails	19.00 to 19.50
Cast iron carwheels.....	12.50 to 13.00
No. 1 machinery cast.....	18.50 to 19.00
No. 1 railroad cast.....	15.00 to 15.50
Burnt cast	10.00 to 10.50
Stove plate	10.00 to 10.50
Brake shoes	10.25 to 10.75
Railroad malleable	14.75 to 15.25
Agricultural malleable	13.75 to 14.25

Finished Iron and Steel.—Mill operations have sagged sharply owing to the usual holiday lull and the disposition of the mills not to produce in excess of the demand. Bethlehem Steel Co. is down to a 50 to 60 per cent operation of mills and a corresponding drop in open-hearth operation. Several sizable structural jobs are out, but have not yet been awarded. Reinforcing bars are slow. Mills are confident of good conditions during the first quarter.

Detroit Scrap Higher

DETROIT, Dec. 24.—The market on old material is stronger, with hydraulic compressed registering an advance of 50c. to 75c. a ton, while heavy melting and shoveling steel, borings and flashings are 25c. higher.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	\$13.75 to \$14.25
Borings and short turnings	9.25 to 9.75
Long turnings	8.50 to 9.00
No. 1 machinery cast.....	14.00 to 15.00
Automobile cast	19.00 to 20.50
Hydraul. comp. sheets....	13.50 to 14.00
Stove plate	11.00 to 12.00
No. 1 busheling.....	11.00 to 11.50
Sheet clippings	8.00 to 8.50
Flashings	11.75 to 12.25

Buffalo

Pig Iron Shipments Heavy—Steel Mill Operations Sag—Scrap Market Is Stronger

BUFFALO, Dec. 24.—The inquiry for pig iron in this territory is light over the holiday period, but shipping directions are extremely good and in some instances have been put ahead of schedule. The melt is exceptional. The General Electric Co. inquiry for 5700 tons for its various plants is still open, but the probability is that it will be placed very soon. A Pennsylvania melter seeks 300 to 400 tons of malleable, and an inquiry from the eastern part of the State is for 500 tons of foundry. An interest in the Buffalo district has inquired for 500 tons of low silicon malleable. A Donner furnace, which has been out for repairs, is expected to go back in blast about Jan. 1. Prices in the district are firm, but on sizable business for outside shipment differentials on silicon content are sometimes shaded.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25.	\$18.00 to \$18.50
No. 2X fdy., sil. 2.25 to 2.75	18.50 to 19.00
No. 1X fdy., sil. 2.75 to 3.25	19.50 to 20.00
Malleable sil. up to 2.25..	18.50 to 19.00
Basic	17.50 to 18.00
Lake Superior charcoal...	27.28

Old Material.—Buying has been occasional, but the market is strong, with a shortage of several grades, notably No. 1 heavy melting steel. Brokers in Youngstown and Pittsburgh have been offering \$18, delivered to those points, for hydraulic compressed and No. 1 steel. This has

drawn considerable of these grades from this territory. Dealers here predict \$18 for heavy melting steel within 30 days. Reduced operation of plants supplying turnings to the market has created something of a shortage for blast furnace requirements. There have been several sales of railroad knuckles and couplers and rolled steel wheels at \$17.50 to \$18 and some short shoveling turnings have been sold at \$12.50 to \$13. It is understood that the last tonnage of hydraulic compressed sold in this district brought \$17, though this may be an outside price.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades

No. 1 heavy melting steel.	\$15.50 to \$16.50
No. 2 heavy melting steel.	13.25 to 14.00

Agricultural	16.00 to 16.50

A. O. Smith Pipe Orders Total 174,500 Tons

The A. O. Smith Corporation, Milwaukee, in recent weeks, has received orders for five major pipe lines, calling for 174,500 tons of electrically welded steel pipe. The new lines, which have been mentioned in THE IRON AGE markets at the times of the individual lettings, are as follows: Tulsa, Okla., to Lockport, Ill., requiring 636 miles of 12-in. pipe, 70,000 tons; part of Roxana line, calling for 100 miles of 10-in. pipe, 8500 tons; El Paso natural gas line from El Paso, Tex., to Lea County, N. M., involving 205 miles of 16-in. pipe, 23,000 tons; Western Public Service line from Baxter Basin to Salt Lake City and Ogden, Utah, calling for 287 miles of 14, 16 and 18-in. pipe, 33,000 tons; and a gas line, the details of which are to be announced later, 40,000 tons. The Smith Corporation made its first shipment of pipe in September, 1927.

The Weirton Steel Co., Weirton, W. Va., has contracted with the Rust Engineering Co., Pittsburgh, for the construction of a Kathner-type normalizing furnace, employing removable bung sections over the entire length of the furnace to provide easy access to the alloy rolls. The furnace will be 84-in. wide inside and 222-ft. long. It will have a capacity of 200 tons of normalizing sheets per day, using coke oven gas for fuel. The Duraloy Co., Pittsburgh, will furnish the alloy disks and shafts.

Belgian Prices Less Firm

Exporters Still Delay Buying, But Germany Is Not Yet Able to Compete—Pig Iron Quiet

ANTWERP, BELGIUM, Dec. 7.—The number of actual transactions in iron and steel is decreasing, but with slight weakness of prices evident, there is a good volume of inquiry from buyers seeking substantial concessions. Mills, however, are fairly well booked with orders and not inclined to shade present prices. Settlement of the German lockout has not brought any serious reaction in the market, but it is estimated that the German suspension has represented a loss of about 1,600,000 tons of steel production, of which about 350,000 tons would have gone for export. Buyers for export have been delaying purchases for a possible decline in prices following the end of the lockout, but German domestic demand is heavy and German mills are not seeking export tonnage at present, so some good export business is expected to develop with Belgian and French producers.

Pig Iron.—The market is quiet and prices unchanged at 118 Belgas (\$16.41) per ton for No. 3 phosphoric foundry iron, f.o.b. furnace. For export, the price is reported firm at £3 5s. (\$15.80) per ton, Antwerp, and occasional sales of small lots bring £3 6s. to £3 7s. (\$16.04 to \$16.28) per ton. British pig iron continues a factor in Bessemer and

hematite grades. The scrap market is strong and available supplies small. Open-hearth furnace steel is quoted at 103 Belgas (\$14.33) and No. 1 cast scrap for foundries at 128 Belgas (\$17.80).

Semi-Finished Material.—Consumers are seeking concessions, but most mills are well booked with orders for a number of weeks and show no inclination to accept lower than present prices. Billets are quoted at £5 2s. (\$24.79) per ton, Antwerp, for 2-in. and £4 18s. (\$23.81) per ton for 3-in. Sheet bars are firm at £5 (\$24.30) per ton, f.o.b. Antwerp.

Finished Material.—Mills are well provided with tonnage and not inclined to grant concessions sought by buyers, except on certain products. Steel bar prices are slightly easier for large sizes. On desirable specifications steel bar quotations have declined to £6 2s. per ton (1.34c. per lb.), f.o.b. Antwerp and for early delivery, premiums have brought the price to £6 3s. and £6 3s. 6d. per ton (1.35c. and 1.36c. per lb.), f.o.b. Antwerp. Normal specifications of beams bring £5 2s. per ton (1.12c. per lb.). Hot rolled hoops are quoted at £6 5s. per ton (1.37c. per lb.) and cold rolled hoops at £10 15s. per ton (2.37c. per lb.), f.o.b. Antwerp.

Brown-Lipe Gear Now Part of Unit Corporation

The Unit Corporation of America, Milwaukee, has announced the acquisition of the Brown-Lipe Gear Co., Syracuse, N. Y., as the fifth manufacturing unit to come under its control, all being engaged in the production of transmission units for automobiles, motor trucks and tractors. The Milwaukee concern originally was a consolidation of the Dallman Machine & Mfg. Co., and the Obenberger Forge Co., both of Milwaukee. Later it acquired the Universal Power & Equipment Co., Detroit, and a short time ago the Fuller & Sons Co., Kalamazoo, Mich., was added.

Coes Wrench Co. Acquired By Bemis & Call

The Bemis & Call Hardware & Tool Co., Springfield, Mass., has purchased the business of the Coes Wrench Co., Worcester, Mass., and will consolidate the manufacture of this line of screw wrenches in the Springfield factory. The Coes Wrench Co. is closely affiliated with Loring Coes & Co., manufacturers of machine knives, and this

business will continue at Worcester without change. In announcing the consolidation it is stated that there are brought together the largest American manufacturers of monkey wrenches and combination wrenches.

The Coes company was founded by Loring Coes, inventor of the screw wrench. With his brother, Aury G. Coes, he established a small factory in Worcester in 1840 for the manufacture of the newly invented wrench. The business grew rapidly, requiring from time to time increased facilities, until finally the present plant was erected in about 1875. J. C. McCarty, New York distributor of the Coes wrench, will handle the Bemis & Call line.

Hamilton, Ohio, Machinery Firms Are Merged

The Niles Tool Works Co., Hamilton, Ohio, subsidiary of the Niles-Bement-Pond Co., New York, and the Hoover, Owens, Rentschler Co., also of Hamilton, have been consolidated under the name of the General Machinery Corporation. The plants of the two companies adjoin and the consolidation will offer many advan-

tages in continuing the manufacture of heavy machinery. The Niles-Bement-Pond Co. will receive common stock in the new corporation in exchange for the stock of its subsidiary.

G. A. Rentschler, president of the Hoover, Owens, Rentschler Co., will be president of the new concern; Gordon S. Rentschler, assistant to the president; William B. Mayo, chief engineer Ford Motor Co., A. A. Byerlein and Curtis T. Ziegler, vice-presidents, and Walter A. Rentschler, secretary and treasurer.

Steel Towers Support Aviation Beacons

THE steel tower shown in the accompanying illustration, which has been erected on Mount Diablo in California by the Standard Oil Co. of California, is one of a system being established on the Pacific Coast by the Airways Division, Department of Commerce. The beacon is equipped with a 10,000,000-cp. light and the 3-ft. drum is rotated by a water-tight motor through gears at 6 r.p.m., thus giving the aviator an opportunity to pick up the flash of the beacon every 10 seconds. The code letters "SD," 10 or 12 ft. in height, are hung on the tower and are outlined in Neon lights. Twenty-three of these beacons have been established between Las Vegas, N. M., and Los Angeles and another airway between Los Angeles and San Francisco will have 34 such lights.

Non-Ferrous Metal Markets

Copper Active and Firm, Tin Very Quiet and Steady, Lead and Zinc Prices Unchanged with Sales Light

NEW YORK, Dec. 24.

Copper.—Despite the holiday season, buying by both foreign and domestic consumers has been of substantial proportions during the last few days. Foreign demand has been larger than domestic, particularly from Germany. Sales on Saturday, Dec. 22, were about 6000 tons, and the total foreign sales thus far this month are estimated at about 30,000 tons. Foreign buying has included January and February principally, but considerable metal must yet be bought for those positions.

*Refinery quotation; delivered price ¼c. higher.

Domestic buying, which has been quite substantial, has been largely for February delivery, with sales for March more liberal. Speculation is again active as regards prices, and opinion is heard in some quarters that quotations may be advanced before Jan. 1, particularly if present volume of demand continues. Prices are very firm at 16c., delivered in the Connecticut Valley, and at 16.25c., c.i.f. European ports, for electrolytic copper. The Lake copper market is moderately active, with prices steady at 16.12½c., delivered, and sales abreast of production; purchases into March are reported.

Tin.—One of the duller markets in many weeks is the record of the week just passed. Sales totaled only slightly over 200 tons, caused partly by the general uncertainty concerning

the future trend of the market and the approaching holidays. Neither dealers nor consumers are interested, but it is predicted that the latter will begin to buy when Straits tin falls under 49c. Today the market was stagnant with many offices closed or closing, and spot Straits tin was nominal at 49.62½c., New York. London prices were little changed from those reported on Dec. 18, with spot standard at £224, future standard at £223 15s. and spot Straits at £224 2s. 6d. The Singapore price today was £226 5s.

Lead.—Demand is sluggish and consumers are booked well ahead. Prices are fairly steady at 6.35c., St. Louis, and the leading interest continues to maintain its contract quotation at 6.50c., New York. London prices have declined considerably lately, so much

Non-Ferrous Rolled Products

Mill prices on bronze, brass and copper products are unchanged. Zinc sheets are quoted at 9.75c., base, and lead full sheets at 10.25c. to 10.50c.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

so that there is some prospect of Mexican lead coming into this country, and there is a possibility that this may be permitted in view of the condition of supplies, so that the trend of prices may be slightly downward in the near future.

Zinc.—Demand for prime Western is very light, but the price situation is decidedly strong, at 6.35c., East St. Louis, and 6.70c., New York, for delivery through the first quarter. Ore prices were again unchanged last week at \$40, Joplin. Sales were 10,600 tons and production was 12,700 tons. Each week an advance in the ore price has been expected and it may develop soon. Producers are booked well ahead, but considerable metal must still be bought for the first quarter.

Antimony.—This market is quiet with quotations firm at 9.75c. for spot and 9.62½c. for futures, New York, duty paid.

Nickel.—Ingot and shot nickel in wholesale lots is quoted unchanged at 35c. and 36c., respectively. Electrolytic

nickel in cathode form is quoted at 37c. for this year's delivery, but for 1929 it will be obtainable on the same basis as for ingot and shot nickel.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is quoted at 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

DEC. 24.—This market is dull and prices are steady with the exception of antimony, which has been advanced. Sales of old metals are small and few in number, but prices are holding.

Prices, per lb., in carload lots: Lake copper, 16.25c.; tin, 50.50c.; lead, 6.45c.; zinc, 6.45c.; in less-than-carload lots: antimony, 11c. On old metals we quote copper wire, crucible shapes and copper clips, 12.50c.; copper bottoms, 11.25c.; red brass, 10.75c.; yellow brass, 8.25c.; lead pipe, 5c.; zinc, 3.50c.; pewter, No. 1, 27c.; tin foil, 27c.; block tin, 39c.; aluminum, 12c., all being dealers' prices for less-than-carload lots.

Coal Production Continues Heavy

Output of bituminous coal in the week ended Dec. 15 is reported by the United States Bureau of Mines at 11,024,000 net tons, a loss of 1.8 per cent from the 11,211,000 tons of the preceding week. Total production for November is given at 45,762,000 tons, which was 13 per cent above the 40,468,000 tons mined in November, 1927. It showed a drop of 4,600,000 tons, however, from the total for October, 1928, accounted for wholly by the difference in number of working days.

Anthracite production in November was reported at 7,458,000 tons, compared with 8,554,000 tons in the preceding month and with 6,854,000 tons in November, 1927.

For the elapsed portion of the calendar year, through Dec. 15, production has been 473,100,000 tons of bituminous coal and 74,115,000 tons of anthracite. Both are lower than last year, when bituminous coal was raised to the total of 499,848,000 tons, up to Dec. 15, and anthracite, 77,682,000 tons.

Reinforcing Steel

Illinois Highway Work Will Take 2250 Tons

WITH Illinois State highway work calling for 2250 tons and five junior high schools at Chicago, 1500 tons, new projects totaled more than 6700 tons. The following awards, amounting to 2100 tons, include no projects of outstanding size:

RICHMOND HILL, N. Y., 175 tons, telephone building, to Concrete Steel Co.

JERSEY CITY, 800 tons, Delaware Lackawanna & Western Railroad terminal; from Turner Construction Co., general contractor, to Jones & Laughlin Steel Corporation. About 7500 tons yet to be placed.

MARION, N. J., 115 tons, bridge work for Pennsylvania Railroad; from Arthur McMullen Co., general contractor, to McClintic-Marshall Co.

BIRMINGHAM, 180 tons, warehouse for Long-Lewis Hardware Co., to Connors Steel Co.

NEW ORLEANS, 175 tons, new building for Young Men's Gymnastic Club, to Connors Steel Co.

PITTSBURGH, 100 tons, building for Whitaker Paper Co., to Carlem Engineering Co.

CHICAGO, 125 tons, warehouse, to Concrete Engineering Co.

CHICAGO, tonnage not stated, salesroom for Studebaker Corporation, to Inland Steel Co.

LOS ANGELES, 200 tons, apartment building, 521 South Hobart Street, to unnamed interest.

OLYMPIA, WASH., 200 tons for highway work, to Northwest Steel Rolling Mills.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BALTIMORE, 800 tons, bridge over Chesapeake Bay.

WASHINGTON, 1000 tons, building for United States Bureau of Internal Revenue.

CHICAGO, 1500 tons, five junior high schools; previous bids rejected.

CHICAGO, 450 tons, Fine Arts Building.

UNIVERSITY CITY, Mo., 400 tons, high school.

SPRINGFIELD, ILL., 2250 tons, highway paving and bridge projects for Illinois Highway Commission; bids opened.

HELENA, MONT., 121 tons, Missouri River bridge; bids opened.

SACRAMENTO, 113 tons, highway work in Los Angeles County; bids Dec. 26.

Railroad Equipment

Louisville & Nashville Orders 2500 Freight Cars

OUTSTANDING in a rather quiet week were orders for 2500 freight cars for the Louisville & Nashville and 100 gondola cars for the New York Central. Details of the week's business follow:

Louisville & Nashville has ordered 1200 gondola cars from Pressed Steel Car Co., 750 automobile and 250 gondola cars from Mount Vernon Car Mfg. Co. and 300 box cars from Pullman Car & Mfg. Corporation.

New York Central has ordered 100 70-ton high-side gondola cars from Merchants' Dispatch, Inc.

Chicago, Rock Island & Pacific has revised its inquiry for gas-electric cars and is now asking for bids on 14 instead of eight.

Norfolk & Western is inquiring for 10 baggage and express cars and five mail and baggage cars.

Wabash has ordered 35 single-sheathed automobile cars from American Car & Foundry Co.

Great Northern has ordered six 4-8-4 type locomotives from Baldwin Locomotive Works.

Atchison, Topeka & Santa Fe has ordered four 4-8-4 type locomotives from Baldwin Locomotive Works.

National Railways of Mexico are inquiring for three locomotive tenders.

Georgia Northern is inquiring for one Pacific type locomotive.

Pressed Metal Business Makes Substantial Gains

The Peter Smith Heater & Mfg. Co., which 14 months ago changed its name from the Peter Smith Heater Co. coincident with its purchase of a pressed metal plant at Fordson, Mich., reports a 62 per cent gain in its pressed metal business from Dec. 1, 1927, to Dec. 1, 1928, compared with the previous year.

Orders in October and November were 40 per cent above the average of several months previous. The company does pressed metal work for automobile companies and for railroads, in addition to its heater business. It reports excellent prospects for 1929, and expects to operate its plant at capacity.

Study Simplification of Copper Alloys

A committee of producers, consumers and trade paper representatives, under leadership of G. H. Clamer, Ajax Metal Co., Philadelphia, in cooperation with Non-Ferrous Ingot Metals Institute, is compiling and comparing the many specifications for copper alloys in ingot form, and collecting statistics on the amount of metal sold under each. It is hoped that this study will lead to a simplification of present practices, and the adoption of a few compositions with definite chemical limits to form the bases of trade paper quotations.

Rogers Brown & Crocker Brothers, brokers in pig iron, coke, ores and fluorspar, will hold their annual general sales conference at New York, Dec. 27, 28 and 29.

PERSONAL

HAROLD L. STEVENS has been elected president of the Danville Structural Steel Co., Danville, Pa. This is a re-rolling plant which was largely rebuilt last year, having two mills with combined capacity of about 12,000 tons a month. Old rails are transformed into reinforcing bars, tubing, fence posts and other specialties. Mr. Stevens, who was graduated at Cornell University in 1895, was most recently connected with A. Johnson & Co., importers, New York. Some years ago he was with Sweet's Steel Co., Williamsport, Pa., having built a large part of that plant. Later he was at Buffalo, with the Lackawanna Steel Co., thence going to Boston as district sales manager. When the Lackawanna plant was acquired by the Bethlehem Steel Corporation Mr. Stevens became sales manager Central Iron & Steel Co., Harrisburg, Pa.

C. NEWMAN DAWE is in charge of the automotive division at the Detroit office of the Vanadium Corporation of America, which has recently been removed from 1355 Book Building to 2440 Book Tower. T. N. BOURKE is assistant manager of the division.

CHARLES HARDY, of Charles Hardy, Inc., Pershing Square Building, New York, dealer in tungsten and ferro-alloys, will sail on Dec. 29 for a stay of several weeks in Europe.

DAVID MANSON, for the last 36 years traffic manager for the Ohio Iron & Metal Co., First National Bank Building, Chicago, will retire from active business on Dec. 31. In his capacity with the Ohio company he had become one of the best known men in the scrap iron business.

M. A. POSSONS has been appointed manager of the New Process Stove Co., division of the American Stove Co., Cleveland, succeeding the late JOHN G. WAY. Mr. Possons has been superintendent of the company and has been connected with it about 40 years.

EDMUND P. BURKE, for the past several years identified with the sales organization of Truscon Steel Co. at Los Angeles and San Francisco, has been transferred to Youngstown, where he will be an assistant to C. I. AUTEN, vice-president.

C. D. DALLAS, president of the Dallas Brass & Copper Co., Chicago, has been elected first vice-president and a member of the board of directors of the newly formed Republic Brass Corporation. The Dallas company and each constituent unit will continue to operate under their own names as divisions of the Republic corporation, and the Chicago company will continue the same offices and personnel.

TAYLOR ALLDERDICE has resigned as president of the National Tube Co., Pittsburgh, according to information received as THE IRON AGE goes to press. It is understood that he will be succeeded on Jan. 1 by FRED W. WATERMAN, who had charge of the construction of the Gary tube works of the National company. Mr. Allderdice became president of the company in April, 1926, following the retirement of William B. Schiller, having served as vice-president in charge of operations since 1902. He became identified with the steel industry in 1881 with the old Pittsburgh Bessemer Steel Co., Ltd., Homestead, Pa., which was later absorbed by Carnegie, Phipps & Co., Ltd., and was the nu-

TAYLOR ALLDERDICE

cleus of the present Homestead works of the Carnegie Steel Co. He continued this association until 1892, when, after spending a short time with the Pottsville Iron & Steel Co., Pottsville, Pa., he became associated with the National Tube Works Co. at McKeesport, Pa., in charge of the erection and operation of the new Bessemer steel works of the Monongahela Furnace Co. which had just been acquired by the National company.

MYRON C. TAYLOR, chairman of the finance committee of the United States Steel Corporation, New York, has made a gift of \$1,500,000 to Cornell University for a new building for the law school at Ithaca, N. Y.

RAY T. BAYLESS, editor of publications for the American Society for Steel Treating, and J. EDWARD DONNELLAN, secretary of the organization's recommended practice committee, will arrive in Los Angeles on Dec. 31 to aid in making arrangements for the Western Metal Congress to be held in that city on Jan. 14 to 18. They will be given a reception by the Los Angeles chapter of the society early in the new year.

WILLIAM G. WEISS, who has been manager of the mill and warehouse department of Briggs & Turivas, Chicago, since 1920, has been elected vice-president and treasurer of the Scott-Weiss Steel Co., 110 South Dearborn Street, Chicago, heretofore known as the Scott Steel Co. In joining this company, Mr. Weiss again becomes associated with CHARLES T. SCOTT, president, with whom he was closely identified in the Briggs & Turivas organization prior to the formation of the Scott company in April of this year. Mr. Weiss was formerly associated with the Whitaker-Glessner Co., Portsmouth, Ohio, and during the World War he served as chief ordnance inspector for the Government, having been located at the plants of the Colorado Fuel & Iron Co., Pueblo, Colo., and the American Sheet & Tin Plate Co., Gary, Ind. Before going with Briggs & Turivas he was identified with the purchasing department of the International Harvester Co.

HARRY W. JONES has retired from the presidency as well as from active participation in the affairs of the Marshall & Huschart Machinery Co., Chicago. He will be succeeded by J. R. PORTER as president and general manager. FRANK SEESE continues as secretary and treasurer.

MRS. JEAN SHASSERE has recently been made manager of the accessory department of Olney J. Dean & Co., 137 South LaSalle Street, Chicago, engineers and manufacturers of reinforcing steel.

CARL F. WEIGEL has been appointed vice-president and general manager of the Hedges-Walsh-Weidner Co., Chattanooga, Tenn., which was recently acquired by the Combustion Corporation of America, 200 Madison Avenue, New York. Prior to the combination of the Walsh & Weidner Boiler Co. and the Casey-Hedges Co., which occurred early this year, Mr. Weigel had been for many years chief engineer of the former company. Until his recent appointment he had served as chief engineer of the combined organization.

HUGH W. RANKIN, for the last eight years identified with the E. W. Bliss Co., Brooklyn, has been appointed Detroit representative for the Thomson Electric Welding Co., Lynn, Mass., with headquarters at 2-219 General Motors Building. Effective Jan. 17, C. W. HILL, who formerly represented the Thomson company in New England, will again handle sales in the entire New England territory as direct factory representative. He will take over the territory now being covered by the Taylor Hall Welding Corporation, Worcester, Mass.

EDWARD T. MONROE has been appointed general purchasing agent of the Buffalo, Rochester & Pittsburgh Railway Co., with headquarters at Rochester, N. Y.

R. L. MATTHEWS has been added to the Chicago sales organization of the Wagner Electric Corporation, St. Louis. He is a graduate of Purdue University and has previously been associated with the Michigan Bell Telephone Co., the Armstrong Cork & Insulation Co. and the National Electric Products Corporation.

GEORGE T. SINKS, until recently with the McMyler Interstate Co., Cleveland, and previously with the Industrial-Brownhoist Corporation, Bay City, Mich., has been appointed vice-president and sales manager of the Otis Engine Corporation, 130 Clinton Street, Brooklyn. EDWIN F. DALEY, who is vice-president and general manager of the company, was, until Nov. 1, chief mechanical engineer for the Morse Dry Dock & Repair Co., Brooklyn, and previously he was for a number of years assistant superintendent of motive power and equipment and director of personnel on the Delaware, Lackawanna & Western Railroad.

GEORGE A. ORROK, consulting engineer, New York, has removed his offices from 124 East Fifteenth Street and 17 Battery Place to 52 Vanderbilt Avenue.

FRED O. SMITH, secretary and manager of purchases for the Vulcan Iron Works, Wilkes-Barre, Pa., has been elected a vice-president of that company. He is also a director of the company and vice-president and a director of the Wilkes-Barre Iron Mfg. Co., Wilkes-Barre.

WILLIAM MILLER, who has been attached to the Philadelphia office, Jones & Laughlin Steel Corporation, Pittsburgh, has been appointed district sales manager in charge of the Atlanta office, which is to be opened in the Healey Building on Jan. 1. T. G. Roberts, formerly in the Washington office, has been transferred to the Philadelphia office as assistant district sales manager. BENJAMIN P. TOLES has been appointed Canadian district sales manager, with headquarters in the Toronto Star Building, Toronto, Ont., of the Jones & Laughlin Steel Products Co., a subsidiary of the Jones & Laughlin Steel Corporation. Mr. Toles' appointment and the opening of this office are effective Jan. 1.

ABRAM F. MYERS, chairman of the Federal Trade Commission, has resigned to accept a position with a motion picture organization. At the request of the President, Mr. Myers will continue with the commission until it disposes of some of its pending cases.

W. M. JENSEN has been appointed Pacific Coast manager Pittsburgh Steel Co., with headquarters in San Francisco. Mr. Jensen for many years was associated with the late A. C. RULOFSON, who represented the company on the Pacific Coast.

Obituary

WILLIAM C. JOHNSON, president of the William C. Johnson & Sons Machinery Co., St. Louis, died at his home in that city last week, aged 82 years. He was born at New Brunswick, N. J., and went to St. Louis when he was 17 years old, where he entered the machinery business. He established his own firm in 1904.

MURRAY MORRIS DUNCAN, one of the most prominent figures in the Lake Superior iron ore industry, with which he was associated for 30 years, and vice-president and director and former general manager of the mines of the Cleveland-Cliffs Iron Co., died Dec. 18, at his home in Ishpeming, Mich., after a long illness. He was 70 years of age. Mr. Duncan was born at Washington in 1858 and was graduated from Lehigh University in 1880. His first employment was with the Cambria Iron Co., Johnstown, Pa., as assistant chemist. In 1897, after experience with several Tennessee companies, he became associated with the Cleveland-Cliffs company as agent of its mines at Ishpeming. In 1908 he was elected a director of the company succeeding the late Peter White who died that year. He was made vice-president and general manager of the mines in 1916 and retained the active management of the company's iron-mining properties until poor health necessitated his retirement. He was a member of the American Institute of Mining & Metallurgical Engineers and of the Lake Superior Mining Institute having served as president of the latter organization.

CHARLES J. RICHARDS, president-treasurer Badger-Packard Machinery Co., machine-tool jobber, and president Richards Machinery Co., manufacturing machinist, Milwaukee, died Dec. 17, after a three weeks' illness. He was born at Manitowoc, Wis., in 1876 and established the machine shop in Milwaukee in 1906, becoming interested in the Badger-Packard business in 1922.

FRANK H. PAGE, president National Equipment Co., Springfield, Mass., maker of candy-making machinery, died on Dec. 19 at his home in that city, aged 64 years. He was born at Holyoke, Mass., and was graduated from the Massachusetts Institute of Technology. He began the manufacture of confectioners' machinery at Springfield in 1891.

HARRY D. PIERCE, former president of the National Sewing Machine Co., Chicago, was drowned Dec. 17 at Palm Beach, Fla.

EDWIN B. ROBINSON, assistant order manager American Steel & Wire Co., Worcester, Mass., died at his home in that city on Dec. 20. He had been associated with the Worcester company for 27 years, beginning in the shops and working up to his last position.

Combustion Engineers to Discuss Steel Subjects

A two-day conference of the combustion engineering division of the Association of Iron and Steel Electrical Engineers will be held on Jan. 23 at the William Penn Hotel, Pittsburgh, and on Jan. 24 in Carnegie Library, Duquesne, Pa. Subjects at the first day's session will be "The Isley Open-Hearth Furnaces;" "The Use of Heat Resisting Alloy Steel in the Steel Plant;" "Furnace Bindings;" "Fuel Utilization Practices in Europe;" "Employees Training for Combustion Work and Cooperation with Other Departments." The second day's session will be devoted to a symposium on gas cleaning and air conditioning.

Pittsburgh district section, Association of Iron and Steel Electrical Engineers will have an all day symposium covering lubrication at the William Penn Hotel, Pittsburgh, Saturday, Jan. 5, by L. P. Tyler, Vacuum Oil Co., Pittsburgh; C. W. Byden, DeLaval Separator Co., New York, and C. O. Norstrum, Keystone Lubricating Co., Philadelphia.

Two Companies to Make Hollow-Rolled Bars

Announcement has been made by the Old Dominion Iron & Steel Works, Belle Isle, Richmond, Va., that a contract has been entered into with the Burden Iron Co., Troy, N. Y., by which that company has the exclusive right—outside of the Old Dominion Iron & Steel Works, Inc.—to manufacture seamless hollow-rolled staybolt iron bars and bolts, under patent rights owned by the Old Dominion company. "Hence," says the announcement, "buyers of this product will have the advantage of a competitive market, the choice of two brands of iron and ample production capacity."

Threading Heads and Taps

A comprehensive catalog of 96 pages has been issued by the Landis Machine Co., Waynesboro, Pa., covering heads, chasers, grinders and taps for thread cutting. Illustrations show clearances, while the tabular matter in the book is such as to aid in selection of equipment for specific purposes.

Davison Coke & Iron Co., which bought the Neville furnace, Neville Island, Pittsburgh, from the American Steel & Wire Co., has plans on paper for another blast furnace on the land which it acquired at the time of the furnace purchase, but it is officially stated that the construction of another stack depends upon future conditions. Building of two more batteries of by-product coke ovens, plans for which have been worked out, also is a future rather than an immediate possibility.

Machinery Markets and News of the Works

Sales at High Peak in 1928

Machine Tool Business Best Since 1919 for Many Companies
and Largest Since War for Others

MACHINE tool business in 1928 was the largest since 1919 for many companies and for some it was the best year since the war. Even war-time records have been equalled or excelled in some districts and by some builders. The gain over 1927 is fully 25 to 50 per cent in all cases.

The improvement in sales in the year is traceable largely to three sources: automobile, aircraft and agricultural implement and machinery. In addition, replacement of obsolete equipment in the general industrial field was far above the average of recent years. Railroads, however, were not conspicuously large buyers.

The outlook for the first quarter of 1929 is regarded most hopefully. Inquiries are numerous, and, while there has been some falling off in the volume of orders in December, a renewed wave of buying is believed to

be in the making, and it is expected that it will get under way early in the new year. Automobile manufacturers are expected to continue as important buyers, while needs for aircraft manufacture are growing.

The Curtiss Aeroplane & Motor Co., Buffalo, continues to buy for a new plant addition. Its purchases, while not as heavy as those recently made by the Wright Aeronautical Corporation, will probably exceed \$200,000. A prospective buyer of tools is the American Cirrus Engines, Inc., temporarily located at 84 William Street, New York, which has taken over a plant at Belleville, N. J., for the manufacture under license of the Cirrus (British) airplane engine.

The Chicago & North Western Railroad is preparing a list which includes about \$140,000 worth of machine tools.

New York

NEW YORK, Dec. 24.—Nearly all machine tool sellers in this market will close their 1928 sales records with the comforting thought that the past year has been the best since the war. For a few companies the 1928 sales may total in dollars more than in any of the war years. There has been some falling off in orders in the past week, but inquiries are numerous and promise a good first quarter. The Curtiss Aeroplane & Motor Co., Buffalo, has continued the placing of orders for equipping a plant addition. It has introduced an innovation in buying in that salesmen and engineers representing various types of machines are called in conference in groups and each company is asked to state its proposition in the presence of competitors, especially as regards production claims.

A new airplane engine manufacturer which is expected to come into the market soon for machine tools is American Cirrus Engines, Inc., which has taken over a plant at 752 Washington Avenue,

Belleville, N. J., for production of Cirrus (British) engines under license. Temporary offices are at 84 William Street, New York. G. G. De Witt is purchasing agent and A. G. Lloyd is production manager. A few tools have been bought by the Wood Newspaper Machine Corporation, Plainfield, N. J.

Niles-Bement-Pond Co. has sold in the past week a wheel press, steam hammer, boring mill, four radial drills, two grinders and an upright drilling machine. Pratt & Whitney division sold three jig borers, four engine lathes, one vertical shaper, two thread millers and a centering machine.

Bids are being asked by Delaware, Lackawanna & Western Railroad Co., 90 West Street, New York, for initial work in connection with electrification of suburban lines in New Jersey, to cost about \$10,000,000. A steam-operated electric generating plant is under consideration near Kearny, N. J., to cost about \$4,000,000 additional. Engineering department of company is in charge.

Empire Architectural Iron Works, Randall Avenue and Truxton Street, New York, has purchased additional property and is reported planning expansion.

Toy Products Mfg. Co., 465 West Broadway, New York, has leased space in building at 585 Broadway, totaling about 20,000 sq. ft. floor space, for expansion.

American Aeronautical Corporation, 730 Fifth Avenue, New York, is considering new aircraft manufacturing plant at Bayshore, L. I., for parts and assembling, to cost more than \$50,000 with equipment.

Claude Neon Lights, Inc., 50 East Forty-second Street, New York, manufacturer of electric displays, etc., with main plant at Long Island City, is arranging for increase in capital from 100,000 to 3,000,000 shares of stock, disposing of 1,000,000 new shares at once, part of proceeds to be used for expansion.

Anheuser-Busch Ice & Cold Storage Co., 979 Brook Avenue, New York, has awarded general contract to Equity Construction Co., 25 West Forty-third Street, New York, for new two-story plant to cost about \$150,000 with equipment.

Lancia Motors of America, Inc., 140 West Fifty-seventh Street, New York, affiliated with Lancia Automobile Co., Turin, Italy, has arranged for sale of stock to total \$2,200,000, part of proceeds to be used for establishment of plant. Company has acquired factory on 14 acres at Poughkeepsie, N. Y., with 129,000 sq. ft. floor space, for output of 3000 cars during coming year.

Manhattan Electrical Supply Co., 11 Park Place, New York, has acquired United States Manganese Corporation, New York, recently formed with capital of \$1,000,000, and will consolidate with organization. About 8400 acres of manganese and mineral properties in Augusta County, Va., is secured through purchase, and Manhattan company is said to be planning installation of plant, with operating, storage and distributing facilities.

Shampan & Shampan, 188 Montague Street, Brooklyn, architects, have plans for two and three-story automobile service, repair and garage building, 100 x 250 ft., to cost over \$200,000 with equipment.

Perryman Electric Co., Thirtieth Street and Fourth Place, North Bergen, N. J., has awarded general contract to Bonanno Brothers, 1827 Bergen Turnpike, for three-story radio equipment manufacturing plant, 80 x 200 ft., to cost about \$80,000 with equipment.

Liberty Auto Radiator Co., 3218 Hudson Boulevard, Jersey City, N. J., will take bids at once for new two-story plant unit, 25 x 100 ft., to cost about \$30,000 with equipment. Flagg & Stades, 665 Newark Avenue, are architects.

Glo-Lite Corporation of America, Inc., 560 Broad Street, Newark, N. J., manufacturer of electric signs and displays, with plant at Irvington, has plans for factory unit at Harrison, N. J., to cost more than \$40,000 with equipment.

American Cirrus Engines, Inc., care of Col. R. Potter Campbell, 62 Montrose

Avenue, South Orange, N. J., president, recently organized to manufacture a British type aircraft motor, has leased factory on Washington Avenue, Belleville, N. J., totaling about 38,000 sq. ft. floor space, for parts and assembling plant.

L. & K. Ice Corporation, 19 West Forty-fourth Street, New York, has plans for artificial ice plant at Newark, consisting of three one-story units, 75 x 132 ft., 73 x 81 ft., and machine division, 25 x 96 ft., to cost more than \$225,000 with machinery. Frank Grad, 1023 Broad Street, Newark, is architect.

Brown Instrument Co., Philadelphia, maker of recording instruments, has removed New York office from 50 Church Street to larger quarters at 1502 Roebling Building, 117 Liberty Street.

New England

BOSTON, Dec. 24.—Machine tool business fell off the past week. Based on active negotiations involving considerable equipment, the trade is confident that good business will be closed during January and February. Several New England machine tool builders are still operating night shifts, and delivery dates on many types of equipment are extended into March and April. Small tool demand continues active.

Standard Foundry Co., Southgate Place, Worcester, Mass., will soon start work on a two-story addition, 35 x 41 ft.

Plans have been made by Bradford Hat Co., Haverhill, Mass., to replace a two-story machine shop recently destroyed by fire.

Equipment of Edward Wilkinson & Co., Inc., 253 Georgia Avenue, Providence, R. I., including a small number of metal-working tools, will be sold at auction Jan. 3.

Lockwood Greene Engineers, Inc., 24 Federal Street, Boston, will close bids Dec. 28 on a one-story and basement machine shop addition, 130 x 123 ft., for New Departure Mfg. Co., Bristol, Conn.

Henry & Richard, 112 West Street, Boston, architects, have plans for a power house, 45 x 60 ft., at State Normal School, Bridgewater, Mass. Pason Smith, 209 State House, Boston, commissioner, is in charge.

Prentice Mfg. Co., Kensington, R. I., manufacturer of buckles, has started work on a three-story plant, 40 x 100 ft., and a three-story unit, 30 x 70 ft.

Crane Co., Bridgeport, Conn., has started work on a plant, 120 x 600 ft., and a three-story cupola and elevator shaft, 32 x 45 ft.

B. F. Sturtevant Co., Boston, manufacturer of blowers, has moved its downtown office to 89 Broad Street.

Narragansett Electric Co., Providence, is arranging fund of more than \$1,400,000 for extensions and improvements next year. About \$500,000 will be used for expansion and betterments at plant on South Street, and about like sum for new power substation in downtown district.

Uncas Mfg. Co., 85 Sprague Street, Providence, has rescinded former contract and made general award to Bowerman Brothers, 70 Bath Street, for two-story addition and improvements to jewelry manufacturing plant, to cost about \$50,000 with equipment.

Gamewell Co., Newton, Mass., manufacturer of fire alarm equipment, has

The Crane Market

VERY little new inquiry for either overhead or locomotive cranes has developed in the past week. A fair number of orders is pending, but prospective buyers are slow to place business. A recent outstanding purchase of overhead equipment was made by the International Paper Co., 11 East Forty-second Street, New York, which closed on 18 hand-power and electric cranes for shipment to Dalhousie, N. B.

In the Pittsburgh district the A. M. Byers Co. has asked for 19 overhead cranes, one slab charger and one cupola charger for its new Ambridge, Pa., plant, as follows: Two 10-ton, 65-ft. and 80-ft. spans; six 15-ton, 40, 90 and 120-ft. spans; three 25-ton, 45, 80 and 90-ft. spans; two 20-ton, 85-ft. spans; four 35-ton, 40, 70, 85 and 100-ft. spans; one 5-ton, 25-ft. span, a 2½-ton slab charger and a cupola charger. The Youngstown Sheet & Tube Co. has added one more crane to its recent list of 11 for Indiana Harbor.

Among recent purchases are:

International Paper Co., 11 East Forty-second Street, New York, seven 16-ton, two 10-ton and two 3-ton hand-power cranes from a Canadian builder and one 35-ton, three 17½-ton and three 2-ton electric cranes reported from an American builder in Canada, all for shipment to Dalhousie, N. B.

American Enka Corporation, New York, 20-ton, 42-ft. span, 1-motor and a 10-ton 40-ft. span hand-power crane for Asheville, S. C., from Box Crane & Hoist Corporation.

N. P. Nelson Mfg. Co., Passaic, N. J., 7½-ton, 39-ft. span hand-power crane from Box Crane & Hoist Corporation.

Powell & Minnock Co., Coeymans, N. Y., 2½-ton, 30-ft. span, single I beam, 1-motor crane from Chisholm & Moore Mfg. Co.

Moses Ehrlich Iron & Metal Co., Springfield, Mass., used 7½-ton Brownhoist crawl-tread crane reported from Industrial-Brownhoist Corporation.

David Hummell Building Co., Cincinnati, 20-ton, 64-ft. span overhead crane from Bedford Foundry & Machine Co.

Pittsburgh Forgings Co., Pittsburgh, 10-ton, 60-ft. span crane from Shaw Electric Crane Co.

purchased plant and business of Holtzer Cabot Electric Co., 125 Amory Street, Boston, manufacturer of signal systems and equipment, and will operate as a division. Purchasing company is authorizing increase in capital from 67,500 to 150,000 shares of stock, part of proceeds to be used for expansion.

C. H. Lockwood, 171 Westminster Street, Providence, architect, has plans for two-story jewelry manufacturing plant for local company, name temporarily withheld, to cost about \$45,000.

Sikorsky Mfg. Corporation, College Point, L. I., manufacturer of aircraft and parts, has awarded general contract to W. J. Shaughnessy, Jr., Inc., 119 Fairfield Avenue, Bridgeport, Conn., for new plant at Stratford, Conn., to cost over \$400,000 with machinery. Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, is architect and engineer.

Rhode Island Malleable Iron Works, Hills Grove, R. I., has purchased capital

stock of Rhode Island Fittings Co., Providence, R. I. Malleable Iron Works is a jobbing foundry, making all kinds of castings and specializing in manufacture of pipe union castings. Fittings company will continue to be operated as separate unit, and will have same officers as Malleable Iron Works.

Philadelphia

PHILADELPHIA, Dec. 24.—Contract has been let by Brinton Foundry Co., Paul and Van Dyke Streets, Philadelphia, manufacturer of iron castings, to Davidson & Lavery, 4438 Leiper Street, for one-story addition, to cost about \$20,000 with equipment.

Automatic Temperature Control Co., 2500 North Lawrence Street, Philadelphia, has purchased property, 58 x 200 ft., at Germantown, and is said to be planning construction of new plant to occupy entire site.

Philadelphia Air Terminal, Inc., F. B. Biddle, secretary and treasurer, Morris Building, Philadelphia, recently formed by Mr. Biddle, Andrew S. Webb, president S. B. & B. W. Fleisher, Inc., Twenty-fifth and Reed Streets, and associates, has engaged B. Russell Shaw Co., Inc., 810 Olivé Street, St. Louis, engineer, to prepare plans for new airport at South Philadelphia, including hangars, repair and reconditioning shops, oil storage and distributing buildings, project to cost about \$2,000,000. Bids will soon be asked on general contract.

Biddle-Garrett Co., Philadelphia, recently formed by Fenton H. Middleton, 860 North Fifth Street, and associates, plans operation of local plant to manufacture iron and steel specialties, including automobile parts. Harry Hershey, 1233 Lehigh Avenue, is interested in new organization.

Pennsylvania Flexible Metallic Tubing Co., Broad and Race Streets, Philadelphia, has awarded general contract to E. H. Keefer & Son, 1321 Rodman Street, for two-story and basement addition, 45 x 125 ft., to cost more than \$50,000 with equipment. William H. Cookman, 420 West Price Street, is architect.

Plibrico Jointless Firebrick Co., New York Avenue, Trenton, N. J., manufacturer of firebrick and other refractories, has awarded general contract to Nicholson Co., 247 Park Avenue, New York, for addition to cost about \$100,000 with equipment.

Delaware Electric Power Co., Wilmington, Del., recently formed to take over and operate Delaware Power & Light Co., is disposing of bond issue of \$8,000,000, part of proceeds to be used for expansion and improvement in power facilities. Company is affiliated with United Gas Improvement Co., 1401 Arch Street, Philadelphia. T. W. Wilson is president.

American Horseshoe Co., Phillipsburg, N. J., has been acquired by Phoenix Horse Shoe Co., Joliet, Ill., recent purchaser of Bryden-Neverslip Co., Catasauqua, Pa., manufacturer of kindred products, and will be included in merger with that company. American company will retain its real estate and equipment, and plans to convert plant for another line of iron and steel production. E. R. Yarnelle is president of last noted company.

Department of Property and Supplies, Capitol Building, Harrisburg, Pa., is reported planning new steam-operated electric power plant at Capitol Park, to cost

more than \$850,000 with equipment. B. E. Taylor is in charge.

McClintic-Marshall Co., Pittsburgh, has acquired local plant and property of Pottstown Iron Co., totaling about 30 acres, for expansion.

Cincinnati

CINCINNATI, Dec. 24.—The temporary lull in buying incident to the holidays and to the annual inventory period is affecting sales of local machine tool builders, who report that business is being booked in considerably less volume than in November. Inquiries, however, are numerous and indicate a resumption of purchasing shortly after Jan. 1.

An appraisal of local machine tool sales in the past 12 months shows a substantial and unexpected gain over 1927. With hardly an exception, leading machine tool companies report an increase in business ranging from 25 to 50 per cent, the gain over 1927 probably averaging from 30 to 35 per cent. With such a spectacular betterment of conditions, it is not surprising that many machine tool builders did the largest volume of business since 1919.

The improvement in sales the past year can be traced largely to the automobile industry, agricultural implement makers and the airplane industry. Automobile manufacturers bought equipment in much heavier volume than in 1927, and in several cases machine tool companies state that almost all of their gain in business has come from the Detroit district. The tooling up of the agricultural implement plants throughout the country contributed substantially to the bookings of machine tool builders, while the purchase of tools by companies manufacturing airplanes and airplane engines was an important factor in stimulating activities. In addition, replacement of obsolete equipment by companies in the general industrial field was above the average of recent years.

Foreign business, especially from Europe, was in slightly larger volume than in 1927, but in the main was only a small percentage of the total bookings. Machine tool executives are of the opinion that little improvement in that direction can be expected the coming year. Railroad buying was disappointing and there is no sign that carriers will increase tool purchases to an appreciable extent in 1929.

Machine tool manufacturers are looking forward to a prosperous first quarter and buying of new equipment is expected to get under way before the middle of January. It is believed that the automobile industry will continue a prominent factor in the market.

Airport Commission, Columbus, Ohio, F. F. Green, A. I. O. U. Building, chairman, has plans for municipal airport at James Pike and Pennsylvania Railroad, to include hangars, repair and reconditioning shops and other units, to cost \$850,000. R. H. Simpson, City Hall, is engineer.

Electric Auto-Lite Co., Toledo, Ohio, manufacturer of automobile electric lighting and starting equipment, has secured control of Columbus Auto Parts Co., Columbus, Ohio, and will operate as subsidiary for manufacture of tie rods, drag links and other mechanisms for automobile steering wheels. Columbus company is disposing of stock issue to

total \$1,525,000, part of fund to be used for expansion.

Aeronautical Corporation of America, Inc., Cincinnati, recently organized, has engaged H. Neilson Jackson, Mercantile Library Building, architect, to prepare plans for plant at municipal airport to manufacture airplanes. Initial unit will be one-story, 100 x 300 ft., for parts and assembling, to cost more than \$85,000 with equipment. Bids will be asked on general contract in about 30 days.

Shannon Spring Bed. Mfg. Co., 659 South Ninth Street, Louisville, has acquired property at Thirteenth Street and Garfield Avenue, formerly occupied by Mercury Body Co., and will remodel for new plant.

Kentucky Color & Chemical Co., Louisville, has purchased 10 acres at Kearny, N. J., for new plant to cost over \$200,000 with machinery. A machine shop will be installed.

Ebinger Sanitary Mfg. Co., 184 Lucas Street, Columbus, Ohio, manufacturer of plumbing equipment and supplies, has awarded general contract to E. Elford & Son, 555 Park Street, South, for one-story addition to cost about \$40,000 with equipment.

Pittsburgh

PITTSBURGH, Dec. 24.—Machine tool business this month has made a relatively good showing for the final month of the year. As a whole, 1928 has been better in sales and profits than 1927, and there is much optimism over early 1929 prospects.

One of Pittsburgh's district steel companies is expected to place a good-sized list of tools soon after the turn of the new year and the Westinghouse Electric & Mfg. Co. is expected to have a heavy first quarter list, since it bought rather sparingly against its list for this quarter. A. M. Byers Co., having asked for prices on cranes for its new plant at Ambridge, Pa., is expected shortly to inquire for tools for a new machine shop.

Plans are being prepared by Kerotest Mfg. Co., 2525 Liberty Avenue, Pittsburgh, manufacturer of steel and brass valves, etc., for three-story addition, including machine shop, to cost about \$100,000 with equipment. J. T. Steen & Son, Vandergrift Building, are architects.

Hamilton Pump Co., Pittsburgh, recently organized by E. A. Hamilton, 106 Gladstone Road, and associates, plans operation of local plant to manufacture centrifugal and other pumping machinery and parts. C. G. Lane, Jr., 1415 Park Building, will be an official of new company.

Wheeling Steel Co., Wheeling, W. Va., is planning construction of factory branch and distributing plant at Rensselaer, N. Y., for Eastern base, to cost about \$100,000 with equipment.

Commercial Body Co., Bluefield, W. Va., recently formed by B. W. Curry, 912 College Street, and associates, will operate local plant for manufacture of truck and other commercial automobile bodies.

Franklin Creek Oil Works, Franklin, Pa., operated by L. Sonneborn Sons, Inc., 114 Fifth Avenue, New York, is reported planning expansion and improvements at local refinery, with installation of stills, storage and distributing facilities to double present capacity, continuing expansion program started several months ago, to cost more than \$90,000.

Board of Education, Beaver Falls, Pa., contemplates installation of manual train-

ing equipment in new multi-story high school, to cost about \$250,000, for which bids will soon be asked by Carlisle & Sharrer, Martin Building, Pittsburgh, architects.

Board of Education, Administration Building, Pittsburgh, will receive bids until Jan. 3 for steel lockers, suit storage lockers, and other equipment. George W. Gerwig is secretary.

Chicago

CHICAGO, Dec. 24.—Purchases of machine tools are confined largely to odd pieces of equipment. The market does not lack inquiry, but it is evident that much of this will be held over until after Jan. 1.

Whiting Corporation, Harvey, Ill., is moving slowly in tabulating bids against its list. Buda Co., Harvey, Ill., has purchased a few items and bids have been made on the Austin Mfg. Co.'s list. Here and there some indication is given of future railroad purchases. Chicago & North Western is preparing a 1929 budget which includes \$140,000 worth of machine tools. An electrical appliance manufacturer in Milwaukee has ordered a press.

Hayes Body Corporation, Ionia, Mich., will spend \$170,000 for plant improvements and additions.

Hallis & Mead, sheet metal workers, 309 Twenty-fourth Street, Rock Island, Ill., have purchased adjoining property for expansion.

Scott Steel Co., 110 South Dearborn Street, Chicago, has changed its name to Scott-Weiss Steel Co. William G. Weiss, formerly manager of mill and warehouse department of Briggs & Turiyas, Chicago, is vice-president and treasurer.

Hisey-Wolf Machine Co., Cincinnati, maker of portable electric machine tools, has opened branch office at 210 Machinery Hall, 549 West Washington Boulevard, Chicago, in charge of Roy D. Haworth. Complete stock of company's products will be carried.

Atlas-Chicago Co., Chicago, has been sold and transferred to Grolan Mfg. Co., Dayton, Ohio, and will hereafter be known as Atlas Duo-Rail Co., division of Grolan Mfg. Co.

Storkline Furniture Corporation, 4400 West Twenty-sixth Street, Chicago, has asked bids on general contract for one and two-story addition, to cost about \$160,000 with equipment. R. B. Kurzon, 105 West Monroe Street, is architect.

Central Illinois Public Service Co., Public Service Building, Springfield, Ill., is disposing of bond issue of \$5,700,000, part of fund to be used for extensions in power plants and other utilities, including transmission lines. Bids will soon be asked for one-story ice-manufacturing plant at Cairo, Ill., to cost about \$60,000 with equipment.

Pines Winterfront Co., 404-24 North Sacramento Street, Chicago, manufacturer of automatic radiator shutters for automobiles, etc., has awarded general contract to Scown Building Co., 36 West Randolph Street, for two-story plant to cost more than \$800,000 with equipment.

Federal Sign Co., 1215 Nicollet Avenue, Minneapolis, Minn., manufacturer of electric signs and displays, has begun superstructure for two-story and basement plant at 3014 University Avenue, S. E., to cost close to \$40,000 with equipment. Larson & McLaren, Baker Building, are architects.

St. Louis

ST. LOUIS, Dec. 24.—Gaus-Boyer Mfg. Co., St. Louis, care of Harry G. Gaus, Clinton and Main Streets, recently formed with capital of \$50,000, plans establishment of new plant to manufacture refrigerators, equipment to cost about \$25,000.

South Side Machine Co., 4016 Nebraska Street, St. Louis, has plans for one-story plant, to cost about \$40,000 with equipment. Leonard Haeger, 3844 Utah Place, is architect.

Oklahoma Steel Castings Co., 1200 North Lewis Street, Tulsa, Okla., has begun construction of one-story foundry unit for which general contract recently was let to J. R. Forner Co., Ritz Building.

Root Refining Co., El Dorado, Ark., has been organized to take over and expand Root Refineries, Inc., now completing local gasoline refinery. New company has arranged for stock issue to total \$1,545,000, part of fund to be used for plant completion and other expansion. D. P. Hamilton is vice-president.

St. Louis Smelting & Refining Co., 722 Chestnut Street, St. Louis, has purchased properties of Schulte Mining Co., Fredericktown, Mo., including lead deposits, and plans development of latter properties, including refining facilities.

City Council, Kirksville, Mo., has plans for municipal electric light and power plant, to cost more than \$200,000 with equipment. Black & Veatch, Mutual Building, Kansas City, Mo., are consulting engineers.

Buffalo

BUFFALO, Dec. 24.—Bids will be received by Board of Education, Genesee Building, Buffalo, until Jan. 10 for construction of Burgard vocational school, to cost more than \$750,000 with equipment.

Harrison Radiator Corporation, Walnut Street, Lockport, N. Y., has awarded general contract to John W. Cowper Co., M. & T. Building, for three-story addition to cost about \$130,000 with equipment. J. R. Tyler, Bank of Rochester Building, Rochester, N. Y., is architect.

Dry Ice Corporation of America, Inc., 50 East Forty-second Street, New York, manufacturer of freezing material made with carbon dioxide, plans construction of new plant at Niagara Falls, N. Y., to cost over \$100,000 with machinery.

J. P. Devine Co., 1372 Clinton Street, Buffalo, manufacturer of vacuum drying apparatus, chemical machinery, etc., recently acquired by Mount Vernon Car Mfg. Co., Mount Vernon, Ill., is having plans drawn for new plant at Mount Vernon, to cost over \$350,000 with equipment.

Hooker Electro-Chemical Co., Buffalo Avenue and Union Street, Niagara Falls, N. Y., is arranging bond issue of \$1,500,000, part of proceeds to be used for expansion, including new plant at Tacoma, Wash., on which work has been started; latter works will cost over \$1,000,000 with machinery.

Board of Education, Penn Yan, N. Y., plans installation of manual training equipment in new junior high school to cost \$425,000, for which bids will be asked soon on general contract. Carl Ade, 89 East Avenue, Rochester, N. Y., is architect.

Charles Griffin, 24 Garson Avenue, Rochester, and associates, plan operation of plant in name of Griffin & Yengst Metal Finishing Co., recently organized to manufacture metal specialties. Andres Yengst, 50 Mount Vernon Avenue, will also be an official of new company.

Milwaukee

MILWAUKEE, Dec. 24.—Perhaps not since the war has there been a holiday season in which production of machine tools has held up to the extent of this year. Most shops are far behind on deliveries, with buyers exerting pressure to procure shipments. New buying, while not as brisk as in recent weeks, is above normal for this season, and fresh inquiry is excellent.

Nash Motors Co., Kenosha, Wis., has broken ground for a new \$400,000 foundry to be devoted exclusively to casting cylinder blocks, heretofore provided under contract with an independent foundry at Racine, Wis. New foundry is in addition to other extensions being made at Kenosha, Racine and Milwaukee divisions, body plant at Milwaukee, and body stock mills at Pine Bluff, Ark., which call for an expenditure of over \$3,000,000.

Hamilton Aero Mfg. Co., 60 Keefe Avenue, Milwaukee, manufacturer of aluminum alloy and laminated wood propellers for aircraft, has acquired factory at Bremen Street and Concordia Avenue, affording 68,000 sq. ft., or four times the present capacity. Production schedule for 1929 calls for 50 propellers daily. Hamilton Metalplane Co., 530 Park Street, a separate corporation manufacturing complete aircraft, also is planning an increase in output, requiring additional equipment. Thomas F. Hamilton is president and general manager of both corporations.

Eastman Mfg. Co., 1002 North Eleventh Street, Manitowoc, Wis., will be ready for bids Jan. 10 for construction of a one-story shop addition, 60 x 66 ft. Company manufactures hose couplings.

Merrill Buick Sales Co., Merrill, Wis., has placed general contract with Joseph Doheney, local, for a two-story sales and service building, 76 x 85 ft., with basement. Machine shop area will be about 50 x 76 ft. With equipment it will cost about \$55,000.

W. W. Oefflein, Inc., 110 East Wisconsin Avenue, Milwaukee, has contract to build a one-story machine and assembling shop, 200 x 600 ft., as one of three new buildings of tractor division of main works of Allis-Chalmers Mfg. Co., West Allis, Milwaukee.

Public Utilities Commission, Manitowoc, Wis., expects to ask bids about Feb. 1 for an addition to municipal steam generating plant to cost \$250,000. Plans are being made by M. Schroeder, consulting engineer. A. H. Zander is city clerk.

Oneida Gas Co., Rhinelander, Wis., has been granted franchise by city of Merrill, Wis., to build a gas plant and distribution system and is now completing plans, to be ready for bidders about Feb. 1. An investment of \$75,000 is contemplated.

Master Lock Co., 918-926 Juneau Avenue, Milwaukee, manufacturer of pad locks exclusively, has taken additional space in its present building and is in market for equipment to provide 50 per cent increase in production.

Indiana

INDIANAPOLIS, Dec. 24.—Pacific Electric Mfg. Co., 5815 Third Street, San Francisco, manufacturer of electric switches, etc., is planning branch factory at Gary, to cost more than \$50,000 with equipment. I. M. Cohen, 738 Broadway, Gary, is architect.

Bond Electric Corporation, 1120 Division Street, Indianapolis, manufacturer of storage batteries, flashlights, etc., with headquarters at Jersey City, N. J., formerly known as Yale Electric Co., has leased part of plant at 1129 East Twenty-second Street, Indianapolis, for new factory for daily output of about 250 battery units. Arthur Kane is factory manager.

C. R. Wermuth, 1036 St. Marys Street, Fort Wayne, has begun construction of one-story machine shop, 75 x 108 ft., to cost about \$25,000 with equipment. Pohlmeier & Pohlmeier, Central Building, are architects.

Standard Oil Co., 910 South Michigan Avenue, Chicago, has awarded general contract to Hay-Weaver Co., 2410 South Main Street, South Bend, for two-story storage and distributing plant at South Bend, to cost about \$75,000 with equipment.

Chrysler Motor Corporation, Detroit, has authorized one-story addition to branch plant at Newcastle, Ind., 80 x 85 ft., to cost about \$35,000 with equipment.

Knefler-Bates Mfg. Co., 165 Palmer Street, Indianapolis, plans rebuilding part of four-story corn products plant destroyed by fire Dec. 15, with loss reported over \$200,000 including equipment.

Cleveland

CLEVELAND, Dec. 24.—Machine tool business fell off the past week which was not unusual with the holidays near at hand. The only activity among dealers was the sale of a few single tools. Some prospective business will go over until the new year. Deliveries are so far extended on some lines that they have become an important factor and some manufacturers are losing orders to competitors who can make quicker shipments. While not much business is expected during the remainder of the year, the trade looks for a good volume of sales during January.

Continental Carbon Co., 13904 Lorain Avenue, Cleveland, has awarded general contract to David Gilchrist, 97 East Grand Avenue, Berea, Ohio, for two two-story additions, to cost more than \$75,000 with equipment.

Lake Erie Metal Products Co., Dunham Road, Cleveland, is having plans drawn by Henry W. Griene, Engineers' Building, architect and engineer, for new one and two-story plant, 75 x 100 ft., to cost about \$55,000 with equipment.

Spicer Mfg. Co., South Plainfield, N. J., manufacturer of universal joints, axles, and kindred products for automobiles, is said to be planning addition to plant at Toledo, Ohio, to cost more than \$60,000 with equipment.

Board of Education, East Fourth Street and Rockwell Avenue, Cleveland, has rejected bids recently received for one and two-story addition to foundry at 525 Eagle Avenue, and has had plans revised. It will cost about \$45,000 with equipment. Bids will be asked early in January.

George M. Hopkinson, Auditorium Garage Building, is school architect.

Hazel-Atlas Glass Co., Wheeling, W. Va., has plans for one-story addition to machine shop at Zanesville, Ohio, reported to cost over \$50,000 with equipment. C. E. Handsby, 134 West Main Street, Zanesville, is architect.

Ferro Enameling Co., Keith Building, Cleveland, Ohio, manufacturer of enameled steel sheets, etc., has arranged for stock issue to total \$1,737,500, part of proceeds to be used for expansion.

Toledo Edison Co., Toledo, Ohio, is arranging fund of \$3,000,000 for extensions and improvements during 1929, of which more than one-half will be used for expansion at Acme power station, including new generating and other equipment.

Eastern interests engaged in manufacture of sanitary products allied to product of National Sanitary Co., Salem, Ohio, have purchased large holdings in that company and selling organizations of two companies will work in conjunction. Present capacity of National company will be required to take care of increased demand and provision will be made for extensions when necessary. Charles G. Burton continues as president and general manager of company.

Hill Clutch Machine & Foundry Co., Cleveland, has appointed following dealers: Lombard Iron Works, Augusta, Ga.; Murray Co., Dallas, Tex.; D. de Treville, Savannah, Ga.; J. G. Iler, Charlotte, N. C.; Cameron & Barkley, Charleston, S. C., and William G. Moorman, Buffalo.

South Atlantic

BALTIMORE, Dec. 24.—Richmond Car Works, Inc., Richmond, Va., subsidiary of Standard Steel Car Co., Frick Building, Pittsburgh, is said to have plans for extensions and improvements to cost more than \$400,000 including equipment. Work is scheduled to begin in about 30 days.

Port Development Commission, Munsey Building, Baltimore, has plans for one-story warehouse and terminal building to cost about \$500,000, including conveying, elevating and other loading and handling equipment. J. E. Greiner, Lexington Building, is consulting engineer.

Western Electric Co., 195 Broadway, New York, has completed plans for first unit of new plant at River View Park, Baltimore, to manufacture radio and telephone equipment, and will break ground early next year. Work will include several units and power plant, and will cost over \$20,000,000. H. K. Ferguson Co., Cleveland, is engineer and contractor.

Eastern Silica & Chemical Co., Winchester, Va., operating at former plant of Winchester Glass Sand Co., is planning an expansion program, including new mill and pulverizing plant for silica production, to cost over \$50,000 with machinery.

Frank W. Dryden & Sons, Lancaster and Dallas Streets, Baltimore, oils, are planning new storage and distributing plant to cost about \$40,000, with equipment.

Bainbridge Power Co., Bainbridge, Ga., has authorized construction of one-story ice-manufacturing plant, to cost \$55,000 with machinery.

A. A. Whitlock, Berwick, Pa., formerly head of Berwick Gas Co., has organized a company to construct and operate an artificial gas plant at Hickory, N. C.,

with machinery installation to cost about \$100,000.

Bartlett Hayward Co., Scott and McHenry Streets, Baltimore, is planning one-story addition to plate shop, 53 x 315 ft., to cost about \$50,000 with equipment.

James A. Lenfesty, Cambridge Arms, North Charles and Thirty-fourth Streets, Baltimore, has been appointed agent in Baltimore and Washington territory for Hunter Saw & Machine Co., Pittsburgh, manufacturer of metal cutting circular saw blades, sawing machines and kindred products.

Gulf States

BIRMINGHAM, Dec. 24.—Humble Pipe Line Co., subsidiary of Humble Oil & Refining Co., Houston, Tex., has plans for construction of pipe line from Luling to Ingleside, Tex., where parent company has begun work on new refinery. Line will cost about \$1,000,000.

Chevrolet Motor Co., Pioneer Building, Birmingham, headquarters at Detroit, has taken bids on general contract for one and two-story parts and repair building, 118 x 210 ft., at North Twenty-sixth Street and Ninth Avenue, to cost more than \$100,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Ovens, power equipment, conveying and other machinery will be installed in addition to baking plant of Texas Bread Co., 1118 Taylor Street, Houston, Tex., to cost about \$130,000.

W. D. Kennedy, Dallas, Tex., operating Kennedy Machine & Brass Co., 2236 Live Oak Street, manufacturer of brass, bronze, aluminum and other metal castings, and other local industries, has acquired two-acre tract at 3110 Oak Lane Avenue, with one-story building, 100 x 300 ft., for group of factories, including El-Food Corporation and Real Arts Advertising Co., affiliated organizations. New unit will be erected at early date for Kennedy Machine company. Project will cost more than \$200,000.

American Cast Iron Pipe Co., Birmingham, has awarded contract to Southern Steel Works Co., 908 Lucien Avenue, for one-story addition, to cost about \$45,000 with equipment.

C. S. Hamilton Motor Co., Commerce and Pearl Streets, Dallas, Tex., local representative for Chrysler automobile, is planning two-story and basement service, repair and sales building, 120 x 140 ft., to cost about \$120,000 with equipment.

American Potash Co., care of Chamber of Commerce, Odessa, Tex., is planning development of potash properties near city, with raw material equipment for capacity of about 2000 tons per day, refinery, machine shop, boiler plant and other structures, to cost more than \$200,000.

Coronet Phosphate Mining Co., Coronet, Fla., is planning development of phosphate properties near Mulberry, Polk County. Mining equipment will be installed, mechanical washing plant, etc., to cost more than \$65,000. Work will begin in about 30 days.

Detroit

DETROIT, Dec. 24.—Flint Ornamental Iron & Wire Works, Flint, Mich., is having plans drawn for one-story plant, to cost about \$28,000 with equipment. G. Bachman, Pengelly Building, is architect.

Cranbrook School for Boys, Lone Pine Road, Bloomfield Hills, Mich., has plans for addition to arts and crafts school unit to cost about \$50,000 with equipment. Cranbrook Architectural Service, Lone Pine Road, a division of school, is architect.

Consumers Power Co., Jackson, Mich., has plans for one-story equipment storage and distributing plant at Grand Rapids, Mich., with repair department, to cost about \$50,000 with equipment.

Federal Screw Products Co., 3401 Martin Street, Detroit, has awarded general contract to E. D. Jackson, 5930 Commonwealth Avenue, for one-story addition for storage and distribution to cost about \$25,000 with equipment.

Automotive Panel Board Co., Detroit, care of D. E. Hokin, 1475 Boston Boulevard, recently organized by Mr. Hokin and associates with capital of \$350,000 to manufacture panel boards for automobiles and other service, has taken over a factory at Sandusky, Ohio, for new works, to cost about \$75,000 with equipment. Sampel Rosen, Sandusky, will be an official of new company.

Morse Counterbore & Tool Co., 2007 Poplar Avenue, Detroit, is said to be planning installation of additional tools and equipment in machine shop.

Allied Products Corporation, Detroit, recently organized, has taken over and will consolidate Victor-Peninsular Co., 4646 Lawton Avenue; Richard Brothers Die Works, 1560 East Milwaukee Avenue, with branch plant at Hillsdale, Mich., and Indiana Lamp Corporation, Connersville, Ind. R. O. Cunningham is president of Allied Corporation. Expansion is planned.

Federal Mogul Corporation, 11031 Shoemaker Avenue, Detroit, manufacturer of metal bearings, has awarded general contract to Austin Co., for one-story addition, 125 x 175 ft., to cost about \$70,000 with equipment.

Moyer White & Co., 2644 Lenox Avenue, Detroit, have been appointed agents in that territory for Hunter Saw & Machine Co., Pittsburgh, maker of metal cutting circular saw blades, sawing machines and kindred products.

Morris Machine Works, Baldwinsville, N. Y., maker of centrifugal pumps, has removed Detroit office to 730 Fisher Building.

Pacific Coast

SAN FRANCISCO, Dec. 19.—Willard Storage Battery Co., 246 East 131st Street, Cleveland, subsidiary of Electric Storage Battery Co., Philadelphia, is concluding purchase of property at Los Angeles for new plant for Pacific Coast trade, to cost about \$500,000 with equipment.

Thaden Metal Aircraft Corporation, Alameda, Cal., H. V. Thaden, president, is considering construction of airplane manufacturing plant, including parts and assembling, to cost more than \$150,000 with equipment.

W. Templeton Johnson, San Diego, Cal., architect, has plans for five-story automobile service, repair and garage building, 60 x 200 ft., to cost over \$125,000 including equipment.

Washington Electric Co., Stuart Building, Seattle, plans hydroelectric power plant on Columbia River, in Chelan and Douglas Counties, to cost over \$5,000,000 with transmission system.

Bergstrom Steel Co., 613 North Hewitt Street, Los Angeles, has awarded general contract to Union Iron Works for

new one-story plant, 80 x 250 ft., to cost over \$75,000, with equipment.

Kings County Packing Co., Reedley, Cal., has awarded general contract to Austin Co. of California, Inc., Los Angeles, for new plant on four-acre tract at East Oakland, Cal., with main unit two-stories, 180 x 300 ft., machine shop and boiler plant, to cost more than \$250,000 with machinery.

Pacific Public Service Co., Russ Building, San Francisco, operating Coast Counties Gas & Electric Co., Merchants Ice & Cold Storage Co., Los Angeles, and other public utilities, has arranged for stock issue to total \$1,140,000, part of proceeds to be used for expansion and betterments in plants and system. E. Foster Salisbury is president.

California Pear Growers' Association, San Francisco, Frank P. Sweet, manager, is interested in project to construct and operate a cold storage and refrigerating plant and terminal on waterfront, to cost more than \$10,000,000 with equipment.

Canada

TORONTO, Dec. 24.—While machine tool sales have slowed up, due to the holiday season, demand is still fairly active and is decidedly better than a year ago. Inquiries for single tools for replacements are numerous and many indicate a good buying movement early in the new year. Several large lists are being prepared for new plants under construction in Toronto and throughout the Province on which bids will be asked before the end of next month. The railroads are buying for shop replacements and the automotive industry is inquiring for tools both for replacement and new works.

Robert Mitchell Co., 64 Belair Avenue, Montreal, manufacturer of gas and electric fixtures, metal goods, etc., has purchased a site in St. Laurent, Que., and is having plans prepared for a foundry.

Horton Steel Works, Ltd., Bridgeburg, Ont., has purchased adjacent property on Gilmore Street and it is reported that the new site will be used for erection of two new plants same size as present works, which will be remodelled and new equipment installed.

Town of Swansea, Ont., proposes to spend \$125,000 on improvements to sewage disposal plant, including the purchase of new pumping machinery, etc. Wynne-Roberts, Son & McLean, Metropolitan Building, Toronto, are engineers.

Hospice Ste. Anne, Baie St. Paul, Que., is having plans prepared by Raoul Chenevert, 20½ d'Aiguillon Street, Quebec, for an electric light plant, to cost \$50,000.

Rogers Batteryless Radio Co., 90 Chestnut Street, Toronto, is having plans prepared by Horwood & White, 229 Yonge Street, for a new plant, to cost \$200,000. Building will be two stories and basement, 125 x 250 ft.

General Steel Wares, Ltd., 333 Wellington Street, London, Ont., has awarded contract to J. W. Putherbough, Bank of Montreal Chambers, for one-story addition, 150 x 250 ft., to its enameling plant, to cost \$100,000. George Hunt is architect.

Hydro Electric Power Commission of Ontario, University Avenue, Toronto, is preparing plans for addition to power house and gate house at Queenston, Ont., to cost \$4,000,000. Construction work will be started early in the New Year. F. A. Gaby, is chief engineer.

Collingwood Terminals, Ltd., Collingwood, Ont., has awarded contract to Carter-Halls-Aldinger Co., Ltd., Winnipeg, Man., at \$575,000 for superstructure for grain elevator to cost \$800,000. C. D. Howe & Co., Whalen Building, Port Arthur, Ont., are engineers.

Dominion Bridge Co., Ltd., head office, Montreal, has purchased 13 acres at Calgary, Alta., and will start work soon on erection of a \$200,000 structural steel fabricating plant. Company recently acquired control of Riverside Iron Works, Calgary, and contemplates erection of an addition to this plant next spring to cost \$300,000.

Foreign

OFFICIALS of Fox Brothers' International Corporation, 33 Rector Street, New York, have organized Fox Brothers' International Corporation of France, with headquarters at Paris, to carry out operations in that country. Initial work now being placed under way consists of construction of five hydroelectric generating plants on Segura and Jugar Rivers, southern part of Spain, for service at lead mines and railroad operation, as well as for city of Valencia,

to cost close to \$20,000,000 with transmission system.

Metropolitan Water Board, 173 Rosebery Avenue, London, E. C. 1, is asking bids until Jan. 17 for three 200-hp. high compression heavy oil engines with reciprocating pumps for Woodford pumping station, Essex.

Brown-Boveri Electric Co., Berne, Switzerland, has entered into agreement with city of Bucharest, Rumania, for construction of two hydroelectric power plants near that municipality, 15,000-hp. and 10,000-hp. capacity, respectively, to be owned and operated by Brown-Boveri company for period of 19 years, when stations will revert to city. Project is reported to cost about \$1,000,000 with transmission lines.

A railroad company at Dairen, Manchuria, has arranged budget of \$2,000,000 for pier construction in 1929-30 at Kwanchingtz, on north side of bay opposite Dairen, including mechanical loading equipment and devices. It is stated that an excellent opportunity is offered for sale of American-made cargo-handling equipment. Information at office of Bureau of Foreign and Domestic Commerce, Washington, reference China No. 294456.

Coke Ovens Designed for Flexible Operation

TO increase the flexibility of its equipment and its adaptability to meet conditions, which may vary from day to day, the Foundation Oven Corporation, 120 Liberty Street, New York, has rearranged the regenerators in its balanced draft coke oven design. When heating with coke oven gas, only the air passes through the regenerators and a single chamber suffices. To permit the use of producer gas or even of blast furnace gas for heating the oven, when there is a demand for coke oven gas for open-hearth furnace or other uses, the regenerators under the new arrangement are split into two parts, one be-

ing placed above the other, as shown in the illustration.

With this arrangement, whereby both the air and the heating gas for the ovens are separately regenerated, it becomes possible to utilize all of the coke oven gas for sale either to other departments or outside the plant. The ovens still are built with the usual gas duct and nozzles for oven gas, but can be switched over very quickly from the use of one gas to the other as requirements demand. This adaptation does not change the essential features of the heating system, although it permits realizing greater flexibility.
